Präambel

Präambel

Das Studium bei WAREM wird als konsekutiver Studiengang angeboten. Absolventen eines Bachelorstudiums können bei WAREM nach einem viersemestrigen Studium den Abschluss „Master of Science“ erhalten.

Die im Studiengang Water Resources Engineering and Management (WAREM) ausgebildeten Ingenieurinnen und Ingenieure erwerben alle für die Universität Stuttgart wichtigen und zugrundeliegenden Kompetenzen und Kenntnisse, die als Grundlage für ein erfolgreiches Berufsleben dienen.

Sie

• haben vertiefte Kenntnisse über Wasserwirtschaft, Wasserbau, Grundwasser, Geohydrologie, Siedlungswasserwirtschaft, Wasserqualität und verstehen die dabei grundlegenden natur- und ingenieurwissenschaftlichen Zusammenhänge,
• kennen die Methoden zur Entwicklung von wasserwirtschaftlichen Managementkonzepten, haben aber auch gleichzeitig die Fähigkeiten diese zu planen und durch geeignete technische Maßnahmen und Installationen umzusetzen,
• können die Probleme durch und im Umgang mit Wasser- und Wassersystemen vorhersehen, erkennen und bewerten, sowie analytische, modellhafte und experimentelle Untersuchungen planen und durchführen,
• verfügen über die ingenieurwissenschaftliche Fertigkeit zur Entwicklung, zur Planung und zum Betrieb von Anlagen und kennen dabei auch die nicht-technischen Auswirkungen ihrer Tätigkeit,
• verfügen über die Kompetenzen zur organisatorischen und verwaltungsmäßigen Umsetzung der Wassermanagementaufgaben
• können Aufgaben mit interdisziplinärem und internationalem Charakter vor dem Hintergrund kultureller, wirtschaftlicher und politischer Rahmenbedingungen im Team bearbeiten,
• verfügen über eine hohe wissenschaftliche Qualifikation.
Qualifikationsziele

Die im Studiengang Water Resources Engineering and Management (WAREM) ausgebildeten Ingenieurinnen und Ingenieure

- haben vertiefte Kenntnisse über Wasserwirtschaft, Wasserbau, Grundwasser, Geohydrologie, Siedlungswasserwirtschaft, Wasserqualität und verstehen die dabei grundlegenden natur- und ingenieurwissenschaftlichen Zusammenhänge,
- kennen die Methoden zur Entwicklung von wasserwirtschaftlichen Managementkonzepten, haben aber auch gleichzeitig die Fähigkeiten diese zu planen und durch geeignete technische Maßnahmen und Installationen umzusetzen,
- können die Probleme durch und im Umgang mit Wasser- und Wassersystemen vorhersehen, erkennen und bewerten und analytische, modellhafte und experimentelle Untersuchungen planen und durchführen,
- verfügen über die ingenieurwissenschaftliche Fertigkeit zur Entwicklung, zur Planung und zum Betrieb von Anlagen und kennen dabei auch die nicht-technischen Auswirkungen ihrer Tätigkeit,
- verfügen über die Kompetenzen zur organisatorischen und verwaltungsmäßigen Umsetzung der Wassermanagementaufgaben,
- können Aufgaben mit interdisziplinärem und internationalem Charakter vor dem Hintergrund kultureller, wirtschaftlicher und politischer Rahmenbedingungen im Team bearbeiten,
- verfügen über eine hohe wissenschaftliche Qualifikation.

Modul: 50090 Environmental Fluid Mechanics I

2. Modulkürzel: 021420012
3. Leistungspunkte: 6.0 LP
4. SWS: 5.0
5. Modul: 50090
7. Sprache: Englisch
8. Modulverantwortlicher: Apl. Prof. Holger Class
9. Dozenten:
   • Jürgen Braun
   • Holger Class
   • Sergey Oladyshkin
10. Zuordnung zum Curriculum in diesem Studiengang:
    - DoubleM.D. Water Resources Engineering and Management, PO 2012
      ➞ Chalmers -->Incoming -->Semi-Compulsory Modules
    - DoubleM.D. Water Resources Engineering and Management, PO 2012
      ➞ Chalmers -->Outgoing -->Pflichtmodule
    - DoubleM.D. Water Resources Engineering and Management, PO 2012
      ➞ Mara -->Incoming -->Compulsory Modules
    - DoubleM.D. Water Resources Engineering and Management, PO 2012
      ➞ Mara -->Outgoing -->Pflichtmodule
    - M.Sc. Water Resources Engineering and Management, PO 2012
      ➞ Vertiefungsmodule -->Vertiefungsmodule Pflicht
11. Empfohlene Voraussetzungen:
    - Technical Mechanics
      • Introduction to the statics of rigid bodies
      • Introduction to elastostatics
      • Introduction to the mechanics of incompressible fluids
    - Higher Mathematics
      • Partial differential equations
      • Vector analysis
      • Numerical integration
    - Fundamentals of Flow Mechanics
      • Conservation equations for mass, momentum, energy
      • Navier-Stokes, Euler, Reynolds, Bernoulli equation
12. Lernziele:
    Students have fundamental knowledge of flow in various natural hydrosystems and its application in civil and environmental engineering.
13. Inhalt:
    The lecture deals with flow in natural hydrosystems with particular emphasis on groundwater / seepage flow and on flow in surface water / open channels. Groundwater hydraulics includes flow in confined, semi-confined and unconfined groundwater aquifers, wells, pumping tests and other hydraulic investigation methods for exploring groundwater aquifers. In addition, questions concerning regional groundwater management (z.B. recharge, unsaturated zone, saltwater intrusion) are discussed. Using the example of groundwater flow, fundamentals of CFD (Computational Fluid Dynamics) are explained, particularly the numerical discretisation techniques finite volume und finite difference. The
Hydraulics of surface water deals with shallow water equations / Saint Venant equations, unstationary channel flow, turbulence and layered systems. Calculation methods such as the methods of characteristics are explained. The contents are:

- Potential flow and groundwater flow
- Computational Fluid Dynamics
- Shallow water equations for surface water
- Characteristic method
- Examples from civil and environmental engineering

14. Literatur:
Lecture notes: Hydromechanics, Helmig and Class
Lecture notes: Ausbreitungs- und Transportvorgänge in Strömungen, Cirpka

15. Lehrveranstaltungen und -formen:
500901 Lecture and Exercise Environmental Fluid Mechanics I

16. Abschätzung Arbeitsaufwand:
Sum 180 h

17. Prüfungsnummer/n und -name:
- 50091 Environmental Fluid Mechanics I (PL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0
- V Vorleistung (USL-V), schriftliche Prüfung

18. Grundlage für ... :
50170 Environmental Fluid Mechanics II

19. Medienform:
Fundamentals will be developed using the blackboard and presentation tools.

20. Angeboten von:
Institut für Wasser- und Umweltsystemmodellierung
Modul: 50620 Hydraulic Structures

2. Modulkürzel: 021410106
5. Modulduer: 2 Semester

3. Leistungspunkte: 6.0 LP

4. SWS: 4.0
7. Sprache: Englisch

8. Modulverantwortlicher: Univ.-Prof. Silke Wieprecht

9. Dozenten:
   • Silke Wieprecht
   • Kristina Terheiden
   • Daniel Stolz

10. Zuordnung zum Curriculum in diesem Studiengang:
    DoubleM.D. Water Resources Engineering and Management, PO 2012
        → Chalmers -->Incoming -->Semi-Compulsory Modules
        →
    DoubleM.D. Water Resources Engineering and Management, PO 2012
        → Chalmers -->Outgoing -->Wahlmodule
        →
    M.Sc. Water Resources Engineering and Management, PO 2012
        → Vertiefungsmodule -->Vertiefungsmodule Pflicht
        →

11. Empfohlene Voraussetzungen:

12. Lernziele:

   Advanced Studies in Hydraulic Structures:  The students...
   • Know about the basic features of hydraulic structures
   • have an overview what are the main components and know how to arrange them in order to ensure a satisfying operation
   • are able to dimension all parts of different hydraulic structures
   • are aware of implicating river works into an overall context of a fluvial system and know how to act and to evaluate in spatial and temporal interrelation
   • are able to realize the economic and ecologic significance of hydraulic structures as dams, reservoirs and hydro power plants

   Case Study in Hydraulic Structures:  The students...
   • are able to use of the gained theoretical knowledge with the help of a practical example
   • are aware of the technical relations and their effects on non-technical areas of interest
   • can give a well-founded argumentation of chosen estimations and are able to present their own results
   • can give a convincing presentation
   • are able to assess objectively different planning alternatives

13. Inhalt:

   Advanced Studies in Hydraulic Structures: The course deals with main structural components of hydraulic engineering schemes such as weirs, dams, hydro power plants, pipelines and ancillary works. The main features as hydraulic and structural dimensioning are treated. The application of structural power plants, reservoirs and river development works is discussed. Conventional engineering methods as well as approaches with improved environmental compatibility are taken into consideration.

   Case Study in Hydraulic Structures: The case study uses the content of the lecture „Advanced Studies in Hydraulic Structures“. In working
groups of 3 to five students a real hydraulic structures will be planned and completely dimensioned. There are hydraulic calculations to be carried out as hydraulic capacity of spillway, dimensioning of stilling basin, hydrological and sedimentological calculations. As well the stabilities of the structures itself has to be checked. Additionally an analysis of the demand of potentially provided electricity, drinking water or irrigation water, resp. is required. The intermediate results will be presented by the groups. Every student has to deliver at least one presentation. Finally a poster for the final presentation and assessment has to be designed. This is the basis for the development of the assessment criteria for the different alternatives.

14. Literatur: Lecture notes can be downloaded from the internet. Additional detailed information for the case study will be provided during the lectures.

15. Lehrveranstaltungen und -formen: • 506201 Lecture and Practice Advanced Studies in Hydraulic Structures
• 506202 Lecture and Presentation Case Study in Hydraulic Structures,

16. Abschätzung Arbeitsaufwand: Sum 180h

17. Prüfungsnummer/n und -name: 50621 Hydraulic Structures (LBP), schriftlich oder mündlich, 90 Min., Gewichtung: 1.0

18. Grundlage für ...

19. Medienform:

20. Angeboten von:

    → Chalmers -->Outgoing -->Pflichtmodule
    → DoubleM.D. Water Resources Engineering and Management, PO 2012
    → Mara -->Outgoing -->Pflichtmodule
    → M.Sc. Water Resources Engineering and Management, PO 2012
    → Vertiefungsstufe -->Vertiefungsstufe Pflicht
11. Empfohlene Voraussetzungen:
12. Lernziele:
    The students have detailed knowledge about waste avoidance procedures in household and industry. Waste avoidance includes the ecology-oriented daily shopping, the substitution of contaminated materials in the industrial production as well as the Zero Emission Society. In the case of unavoidable waste fractions, the students acquire the competence to establish collection and transportation systems for these wastes, within the logistic, economic and legal frame. Main emphasis is given to the collection of recyclables. The students know the relevant factors which influence the waste amount and waste composition in general and in particular within the separate collection of recyclables. The students are acquainted with the state of the art of recycling technologies for separate collected paper, glass, metal and plastic including the pretreatment process. They have knowledge of the aerobic and anaerobic treatment and utilization of separate collected biowaste. Not avoided and recycled waste has to be treated before disposing off e.g. in a landfill site. The students possess a general knowledge of the mechanical and biological treatment technology as well as of the thermal waste treatment. They are able to evaluate the different treatment and recycling processes from an ecological and economic point of view. The students have knowledge about the most important components of the urban drainage and the basic treatment processes of wastewater. Thus they are able to compare different systems in dependence of changing boundary conditions and assess the effectiveness and pros and cons of the systems, e.g. concerning impacts on the environment, economical and operational aspects. They obtain an understanding for system connections between the urban drainage system and the wastewater treatment system as well as between the urban water system and the environment.
13. Inhalt:
    Solid Waste Management:
    • Waste generation and waste composition
    • National and international regulations for waste
    • Waste avoidance
    • Collection and transport of waste
• Separate collection of recyclables
• Sorting of recyclables
• Recycling technologies for paper, glass, metal, plastic
• Biological treatment of waste
• Waste Disposal
• Ecological indicator systems

Waste Water Technology:
• Basics of urban drainage and municipal wastewater treatment
• Quantity and Composition of Wastewater
• Urban drainage systems
• stormwater treatment
• mechanical wastewater treatment
• biological wastewater treatment
• sludge treatment
• natural close and ECOSAN systems

14. Literatur:
Lecture Manuscripts Solid Waste Management

15. Lehrveranstaltungen und -formen:

11. Empfohlene Voraussetzungen:

12. Lernziele:

**Lecture: Inorganic chemistry**

The students

- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

**Lecture: Organic chemistry**

The students

- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions
- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

Lecture: Biology and ecology of water, soil and air systems

The students
- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries
- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations
- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.
- know important events and scientists in the history of biology
- know basics in ecology of natural and artificial ('technical') ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

Lecture: Technical and medical microbiology for engineers

The students
- know the most important microorganisms being active in plants treating waste water, air and contaminated soil
- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass
- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these
plants; this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

Lecture: Inorganic chemistry

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
- chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
- quantitative Relationships and Stoichiometric Equations
- characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
- descriptive part: selected chemical compounds and their preparation and properties

Lecture: Organic chemistry

- functional groups and compound classes
- classification of chemical reactions in organic chemistry
- organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
- chemical and microbial degradation of organic matter in the environment
- summary parameters
- organic environmental contaminants

Lecture: Biology and ecology of water, soil and air systems

The following topics are presented within the lecture:

- Introduction in history of microbiology
- Important waterbased/water related diseases
- Function of microscopy of staining techniques
- Structure and function of prokaryotic cells
- Structure and function of eucaryotic cells
- Necessity and effects of microbial nutrition
- Microbial growth relations and possible limitations
- Microbial metabolism: Energy production, conservation and release
- Microbial metabolism: Enzymes syntheses and regulation.

Lecture: Technical and medical microbiology for engineers

- Important (sewage) water based /water related diseases/detection and possible countermeasures
- Important soil and air connected diseases
- (micro)biological principles in application of engineering techniques
• Implication of engineer work on ecosystems/environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

15. Lehrveranstaltungen und -formen:

• 191001 Lecture Inorganic chemistry
• 191002 Lecture Organic chemistry
• 191003 Lecture Biology and ecology of water, soil and air systems
• 191004 Lecture Technical and medical microbiology for engineers

16. Abschätzung Arbeitsaufwand:

Time of attendance:

Inorganic chemistry (Schwederski): Lecture, 1 SWS = 14 hours

Organic chemistry (Metzger/Kuch): Lecture, 1 SWS = 14 hours

Biology and ecology of water, soil and air systems (Engesser): Lecture, 1 SWS = 14 hours

Technical and medical microbiology for engineers (Engesser): Lecture, 1 SWS = 14 hours

Exercises for Chemistry and Biology for environmental engineers, 2 SWS = 28 hours

Exam: 2 hours

Sum of attendance: 86 hours

Exercises (group work with presentations): 28 hours

Self-study: 94 hours:

17. Prüfungsnummer/n und -name:

19101 Chemistry and Biology for Environmental Engineers (PL), schriftlich oder mündlich, 120 Min., Gewichtung: 1.0

11. Empfohlene Voraussetzungen:
   none (BAU), advisable LWW_Wabau
   none (UMW), advisable LWW_Gew
   Hydraulic Structures (WAREM)

12. Lernziele:
   **River Engineering and Sediment Management**
   The students...
   • are aware of rivers must be regarded and managed based on an integrated approach
   • know the basic concept of the European Water Framework Directive (WFD) and the German legal framework for river basin management
   • are able to analyze and estimate the consequences of the WFD based inventory for future management
   • are aware of sediment transport processes and of the complexity of the interactions and relations
   • recognize the possibilities and limitations of sediment managements strategies
   **Integrated Flood Protection Measures**
   The students...
   • are aware of the fact that flood protection is an integral process, based on different components (e.g. technical flood protection measures, prevention)
   • know the basic physical processes: dynamics of flood events, calculation of discharges and water depths, flood wave propagation; functionality of retention and protection structures: reservoirs, dams and dikes
   • know 1-D and 2-D numerical hydro-dynamic models
   • are able to apply their knowledge on practical engineering problems related to flood protection

13. Inhalt:
   The module consists of two lectures:
   **River Engineering and Sediment Management**
   • Basic approaches of river basin management (legal framework)
• Systematics and results of basic inventory due to the WFD
• Anthropogenic impacts on river basins
• Origin of sediments and fundamental principles of transport
• Sediment management measures on different scales

**Integrated Flood Protection Measures**

• Socio-economic aspects of flood damage
• Calculation of water depths
• Hydro-dynamic flood wave calculation, Saint Venant-equation
• Technical flood protection measures
• Design and operation of retention basins
• Set-up of damage and risk maps, design of overtopping earthen dams and dikes
• Probability of failure, reliability calculation, flood risk management

---

11. Empfohlene Voraussetzungen: Recommended background knowledge: Basic knowledge of hydrology and geohydrology  
Prerequisite module: none

12. Lernziele:  
Hydrological Modeling: Construction of models for each part in the runoff process and how these models are used and integrated in different environment management systems.
 Integrated model systems for the groundwater management: Design of hydrogeological databases, visualization of data, GIS-Operations for the groundwater and hydrological modeling, Geostatistic, stochastic modeling, Monte Carlo Methods.

13. Inhalt:  
Hydrological Modeling: What happens to the rain? This is the basic question that needs to be addressed in order to predict the amount of discharge at a certain location in a river system at a given time. Which parts of the fate of rainfall can be determined on a physical basis, and which are still left to empirical searching? Beside the qualitative determination of e.g. the processes of evapotranspiration, infiltration, interflow etc. we also need to describe the quantities of these processes to be able to forecast e.g. flood events. Hydrological watershed modelling is fundamental to integrated water management. There are complex interactions between the elements of the environmental continuum. In order to predict future behaviour and to quantify effects of management changes, quantitative mathematical descriptions are needed. A number of advanced hydrological watershed models have been developed in the last 30 years. A few of them will be reviewed in terms of their data needs and there predictive power. The participants are encouraged to form groups and to use their selected models for the same catchment so that the different approaches are compared.
Integrated model systems for the groundwater management:
Modern integrated model systems require techniques for the efficient construction of ground water models and their integration in “Decision Support Systems” as well as strategies for the handling of uncertainties. The course will discuss the specific “GIS-Methods” that are important for the integrations of databases, the visualization of data and the calculation of spatial data like ground water recharge. Special focus is laid on GIS supported hydrological modeling of the ground water recharge and the runoff parameters as well as adequate choice of the hydrological model concepts for the calculation of the local water balance in different data situations. To handle the model uncertainties, geostatistic methods and associated stochastic modeling attempts like the “Monte Carlo Simulation” will be mentioned.

11. Empfohlene Voraussetzungen:
 Recommended background knowledge:
 Higher Mathematics:
   • Partial differential equations
   • Numerical integration
 Fundamentals of fluid mechanics:
   • Conservation equations for mass, momentum, energy
   • Mathematical descr

12. Lernziele:
 Students can select suitable numerical methods for solving problems
   from fluid mechanics and have basic knowledge of implementing a
   numerical model in C.

13. Inhalt:
 Discretisation methods:
   • Knowledge of the common methods (finite differences, finite elements,
     finite volume) and the differences between them
   • Advantages and disadvantages and of the methods and thus of their
     applicability
   • Derivation of the various methods
   • Use and choice of the correct boundary conditions for the various
     methods

Time discretisation:
   • Knowledge of the various possibilities
   • Assessment of stability, computational effort, precision
   • Courant number, CFL criterion

Transport equation:
   • Various discretisation possibilities
   • Physical background
• Stability criteria of the methods (Peclet number)

Clarification of concepts: model, simulation

Application of the finite element method to the stationary groundwater equation Setting-up of a simulation programme for modeling groundwater:

• Programme requirements
• Programming individual routines

Fundamentals of programming in C:

• Control structures
• Functions
• Arrays
• Debugging

Visualisation of the simulation results

    ➔ Zusatzmodule
11. Empfohlene Voraussetzungen:
    Recommended background knowledge: Basic knowledge of statistics
    Prerequisite module: none
12. Lernziele:
    Concepts of Geostatistics:
    Knowledge of the basic geostatistical concepts, difference between
    Kriging and simulation, advantages and disadvantages of the discussed
    methods, application of Kriging and simulation
    Stochastical Modeling:
    The participants have skills in basic statistical methods used in hydrology,
    like time series analysis, extreme value statistics, parameter estimation
    methods and statistical tests.
13. Inhalt:
    Concepts of Geostatistics:
    Geostatistical procedures for the interpolation of measured values,
    assessment of model parameters and planning of Measuring networks
    are dealt with.
    Contents:
    • Introduction
    • Statistical hypotheses: Basic concepts; Regionalized variables;
      Second order stationarity: Intrinsic hypothesis; Comparison of the two
      hypotheses; Selection of the regionalized variable
    • The variogram; The experimental variogram; The theoretical
      variogram; Variogram models; Variogram fitting; Isotropy — anisotropy
    • Ordinary Kriging: Point kriging; Block kriging; Properties of ordinary kr.;
      Kr.as an interpolator; Kr. and the variogram; Practice of kr.;Selection
      of the neighbourhood; Kr. with a “false” variogram; Cross validation; Kr.
      with uncertain data; Simple Kr.
    • Non stationary methods: Universal kr.;Intrinsic random functions of
      order k; External-Drift-Kr.
    • Indicator Kriging; Indicator Kriging; Applications
    • Kriging with arbitray additional information: Markov-Bayes-Kriging;
      Simple Updating (SU)
    • Time dependent variables
    • Simulations: Basic definitions; Monte Carlo; Turning Band;
      Unconditional simulation; Conditional simulation; Sequential
Simulation; Simulation using Markov Chains; The Hastings Algorithm; Simulated annealing; Indicator Simulation; Truncated-Gaussian Simulation; Application of simulations

- Exercises

**Stochastical Modeling:**
The lecture part stochastic modeling is primarily concerned with the stochastic analysis of temporal and areal arrays, their generation and their use in the hydrological modeling. Calculation and analysis of hydrological data, descriptive statistic and their parameters, possibility analysis, correlation and regression, time series analysis and simulation.

**Content:**
- Univariate Statistics and multivariate Statistics (e.g. regression analysis)
- theory of probabilities
- random variables and probability functions (e.g. Poission distribution)
- estimation of parameters (e.g. Maximum Likelihood Method)
- statistical tests (e.g. Kolmogorov-Smirnov test)
- extreme value statistics (analysis of the frequency of occurrence of floods)
- time series analysis (e.g.. ARMA Models)
- stochastic simulations (Monte-Carlo Methods)

9. Dozenten: • Hans-Peter Koschitzky  • Kristina Terheiden

11. Empfohlene Voraussetzungen: Basic Knowledge of Structural Engineering

12. Lernziele: Students know basics of structural design, restoration and monitoring of hydraulic structures e.g. (reinforced) concrete or block masonry structures in theory and for practical applications. Furthermore they are able to select and design hydraulic gates and for several purposes.

13. Inhalt: The module contains two parts:

**Structural Design, Restoration and Monitoring of Dams**

Determination of internal forces of tanks, silos, arched dams using membrane and bending theory

FEM for structural hydraulic engineering as large dams (Theory und Practical Application)

Damage and failure of dams

Monitoring of dams

Restoration of dams

**Hydraulic Gates**

Mechanics and Operation of Hydraulic Gates

Design and operating windows

Hydraulics and special problems caused by high speed flows

Maintanance of hydraulic gates

11. Empfohlene Voraussetzungen:
Chemistry and Biology for Environmental Engineers
Sanitary Engineering

12. Lernziele:
Advanced knowledge of processes and concepts for urban drainage and municipal wastewater treatment systems
Basics of construction and dimensioning of different urban drainage systems, stormwater treatment facilities and wastewater treatment plants as a base for dimensioning and discussion of proved and innovative technologies
Deeper understanding for system connections as base for a decisions during the planning process

13. Inhalt:
Design of sewer systems and stormwater treatment
(Dr.-Ing. Ulrich Dittmer)
principles of collection and disposal
design of combined and separate sewer systems
Sustainable urban drainage systems (SUDS) and low impact design (LID)
Application of rainfall runoff models (computer exercise using U.S. EPA Stormwater Management Model)
different techniques for treatment and retention
design of treatment facilities
Design of wastewater treatment plants (Prof. Dr.-Ing. Heidrun Steinmetz)
Municipal wastewater treatment
different techniques for advanced biological wastewater treatment
(nitrogen and phosphorous removal)
principles of process engineering

design of biological wastewater treatment plants and the main important aggregates

design of sludge treatment plants

Seminar: feasibility studies

(Prof. Dr.-Ing. Heidrun Steinmetz and external consultants)

special examples for sanitation concepts for world wide application

Ecological sanitation and resource orientated systems

case studies

11. Empfohlene Voraussetzungen:
Knowledge in Sanitary Engineering, Water Supply and Hydraulics
Contents of Water and Power Supply

12. Lernziele:
• The students learn how to characterize and protect water bodies as well as to improve the water quality
• Students understand the contribution of wastewater treatment to the preventive protection of receiving waters and they learn the basic methods of water quality management instruments
• Students understand the necessity of water treatment as essential element of drinking water supply
• Students learn the chemical, physical and biological background of water treatment technologies, their possibilities and boundaries and they are able to develop, design and dimension treatment schemes for different raw water qualities

13. Inhalt:

Water Quality Management:
• Terms and introduction: environmental data from Germany
• Characterisation and assessment of flowing waters, stagnant waters and groundwater
• Water quality parameters, WHO drinking water guidelines, targets for drinking water and sanitation, description of water quality in relation to use
• Improvement of water quality, reduction of pollution load, point pollutants and diffuse loads, improving the self-purification capacity of waters, technical helps, assessment of progress
• Water quality management; the European Union Framework Directive; quality planning and maintenance, monitoring networks

Water Treatment:
• Water supply and water treatment: basic requirements, drinking water standards
• Mechanical treatment: Screening, Sieving, Sedimentation, (Membrane)Filtration, Gas-Exchange, Flotation
• Carbondioxide-Carbonate-Balance: relevance, chemical background
• Deacidification: mechanical and chemical methods
• Removal of iron, manganese and arsenic: methods
14. Literatur: Lecture notes and material for exercises will be provided during the lecture. Hints are given for additional literature from the internet as well as libraries, e.g.

| 12. Lernziele: | **Power Demand, Supply and Distribution:**

The students…

- know the German, European and worldwide energy markets related to demand, supply and its distribution capabilities
- are aware of that non-renewable energy sources are strictly limited and time-scales for conversion of energy markets long
- have an idea about the relations between energy, politics, social changes and influences on environment
- have a basic knowledge about present energy conversion systems, theoretical limits of efficiencies, and the potential to enhance applied technology
- have a basic understanding about where and how energy is provided and distributed
- comprehend the balance between load and supply in electrical grids and the resulting necessity for control energy.

**Water Demand, Supply and Distribution:**

The students…

- know the German and worldwide water systems related to demand, supply and its distribution capabilities
- have an overview on the water supply situation all over the world.
- recognize the different possibilities and levels of water supply
- have an idea of the relations between water, politics, social changes and influences on environment.

| 13. Inhalt: | **Power Demand, Supply and Distribution:** |
• Energy demand, energy supply
  • Energy generation
    - overview of different types of power plants
    - renewable energy
    - thermal power plants (conventional and nuclear)
  • Areas of application of different power plants
  • Emission control techniques
  • Cooling of thermal power plants
    - methods
    - water resources aspects
  • Energy transport and energy storage
  • Net techniques
  • Energy market
    - trade
    - politics
    - law
  • social changes due to energy supply

**Water Demand, Supply and Distribution:**

• Water supply and water distribution: necessity, basic requirements, elements, hydrological cycle
• Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods
• Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas
• Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems.
• Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters
• Water storage: necessity, types and functions of tanks and reservoirs
• Case study: planning and design of a water supply system for a small town

14. **Literatur:**
Lecture notes can be downloaded from the internet. Hints are given for additional literature from the internet as well as libraries.

    M.Sc. Water Resources Engineering and Management, PO 2012, 4. Semester
    ➞ Zusatzmodule

11. Empfohlene Voraussetzungen:
    Modul „Statistics and GIS“

12. Lernziele:
    The students are able to evaluate different data sources, to carry through basic data acquisition and integrate different data into field and office GIS. They are able to apply spatial analysis techniques to real world GIS problems in environmental and regional planning (GIS-based modeling, network-, raster- and 3D-analysis). The students have the expertise and ability to manage small-scale GIS projects (data mining, analysis design, output delivery) within the planning workflow, from project definition to product delivery.

13. Inhalt:
    GIS-based Data Acquisition
    Lecture:
    • introduction
    • GIS hard- and software for primary data acquisition
    • coordinate systems, geodetic datum and projections
    • coordinate transformations and conversions
    • terrestrial positioning and laser scanning
    • satellite-based positioning (GNSS)
    • overview of other acquisition methods
    • additional topics of mapping
    • data import from various sources (e.g. Web)
    • Web-GIS (e.g. Open Street Map) integration of data into GIS

    Exercices:
    • terrestrial and satellite-based data acquisition (field project)
    • integration of measured data into GIS (computer lab)
    • integration of web-data into GIS (computer lab)

    GIS in Environmental and Regional Planning
    Application cases:
    • land suitability analysis for urban development
    • accessibility of infrastructure facilities
    • Evaluation of soil functions
    • Urban Heat Island modelling
• Biotope Networks and animal movement
• Flood risk
• Development capacity studies
• Site analysis for wind power
• GIS-based E-government and community participation

Tools and methods:
• Model builder
• Spatial Analyst
• Network Analyst
• Map Algebra
• Neighbourhood Analysis
• Regression Modelling
• Multi Criteria Evaluation
• analysis design
• project management

Workflow:
• Geoprocessing,
• remote sensing data integration,
• advanced visual communication

11. Empfohlene Voraussetzungen:

12. Lernziele:

   **Lecture: Inorganic chemistry**

   The students
   - know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
   - know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
   - know about the most important industrial compounds, their preparation and environmental aspects in their application.

   **Lecture: Organic chemistry**

   The students
   - can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions
- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

**Lecture: Biology and ecology of water, soil and air systems**

The students
- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries
- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations
- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.
- know important events and scientists in the history of biology
- know basics in ecology of natural and artificial ('technical') ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

**Lecture: Technical and medical microbiology for engineers**

The students
- know the most important microorganisms being active in plants treating waste water, air and contaminated soil
- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass
- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these
plants; this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

Lecture: Inorganic chemistry

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
- chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
- quantitative Relationships and Stoichiometric Equations
- characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
- descriptive part: selected chemical compounds and their preparation and properties

Lecture: Organic chemistry

- functional groups and compound classes
- classification of chemical reactions in organic chemistry
- organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
- chemical and microbial degradation of organic matter in the environment
- summary parameters
- organic environmental contaminants

Lecture: Biology and ecology of water, soil and air systems

The following topics are presented within the lecture:

- Introduction in history of microbiology
- Important water-based/water related diseases
- Function of microscopy of staining techniques
- Structure and function of prokaryotic cells
- Structure and function of eucaryotic cells
- Necessity and effects of microbial nutrition
- Microbial growth relations and possible limitations
- Microbial metabolism: Energy production, conservation and release
- Microbial metabolism: Enzymes syntheses and regulation.

Lecture: Technical and medical microbiology for engineers

- Important (sewage) water based/water related diseases/detection and possible countermeasures
- Important soil and air connected diseases
- (micro)biological principles in application of engineering techniques
• Implication of engineer work on ecosystems/environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

M.Sc. Water Resources Engineering and Management, PO 2012 → Zusatzmodule |
| 11. Empfohlene Voraussetzungen: | Chemistry and Biology for Engineers  
Sanitary Engineering |
| 12. Lernziele:      | The goal of this course is to provide advanced knowledge of the processes and concepts of constructed wetlands systems to the students. They will get familiar with the existing scientific, technical, and economic practices of using constructed wetlands for wastewater and sewage sludge treatment. For this reason all late scientific developments concerning municipal industrial and agro-industrial wastewater treatment and sewage sludge treatment will be presented. At the end of the course the students will be able to: |
|                     | • Understanding constructed wetlands’ main mechanisms.  
• Perform a rough design of constructed wetlands treating various wastewaters and sewage sludge |
| 13. Inhalt:         | Basic principles of constructed wetlands  
• Attached growth treatment systems  
• Constructed wetlands (basic principles, types, vegetation, porous media, etc)  
• Pollutant removal mechanisms and kinetics (organic matter, nitrogen, phosphorus, heavy metals, suspended solids)  
• Sewage sludge treatment (dewatering mechanisms, mineralization processes)  
Design of constructed wetlands  
• Constructed wetlands’ design models (hydrodynamic and pollutant removal models)  
• Determination of required constructed wetland area  
• Sewage sludge treatment (sludge loading rates, duration of loading and resting periods)  
Case studies  
• Municipal wastewater treatment  
• Agro-industrial wastewater treatment  
Sewage sludge treatment |

15. Lehrveranstaltungen und -formen: 581001 Vorlesung Design of constructed wetlands

16. Abschätzung Arbeitsaufwand: 90 h

17. Prüfungsnummer/n und -name: 58101 Constructed wetlands for wastewater treatment (BSL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0

18. Grundlage für ... :

Modul: 55860 Contaminated site remediation and investigation technologies

2. Modulkürzel: 021410903
5. Moduldauer: 1 Semester

3. Leistungspunkte: 6.0 LP

4. SWS: 4.0
7. Sprache: Englisch

9. Dozenten: • Johan Alexander Huisman • Jürgen Braun

11. Empfohlene Voraussetzungen: Recommended background knowledge:
Basic knowledge in Hydromechanics/Hydraulics/Multiphase flow corresponding to a lecture with approx. 6-8 ECTS
Recommended module: Measurements in the water cycle

12. Lernziele:
The relevant physical principles of subsurface remediation will be reviewed and key remediation technologies will be introduced and discussed. Non-invasive technologies for characterization and monitoring of contaminated sites will also be introduced and discussed. The overall aim is that students will be able to assess the advantages and disadvantages of the available remediation and measurement technologies.

13. Inhalt:
(I) Contaminated site remediation technologies
• Multi-phase flow considerations
• On/off site treatment
• Remediation technologies

(II) Non-invasive contaminated site investigations
• Introduction to site investigation
• Electromagnetic methods (TDR, GPR)
• Electrical methods (ERT, EMI, SIP)
• Direct-push methods
• Time-lapse monitoring with geophysics

14. Literatur:
(I) Selection of learning material for a range of remediation technologies (will be provided).

(II) Selection of learning material for a range of site investigation methods (will be provided). P. V. Sharma, Environmental and engineering geophysics, Cambridge Univ. Press, 1997.

15. Lehrveranstaltungen und -formen:
• 558601 Contaminated site remediation technologies, Lecture
• 558602 Non-invasive contaminated site investigations, Lecture

16. Abschätzung Arbeitsaufwand:
Lecture (I) 24,0
Lecture (II) 24,0
Seminar 8,0
17. Prüfungsnummer/n und -name:  

• 55861 Contaminated site remediation and investigation technologies (PL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0  
• V Vorleistung (USL-V), schriftlich und mündlich

18. Grundlage für ... :  

19. Medienform:

7. Sprache: Englisch

9. Dozenten:
• Hans-Georg Schwarz-von Raumer
• Silke Wieprecht
• Antje Stokman
• Damian Vogt

10. Zuordnung zum Curriculum in diesem Studiengang:
M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Spezialisierungsmodule
M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Zusatzmodule

11. Empfohlene Voraussetzungen:

12. Lernziele:
The students have basic knowledge of environmental aspects in infrastructure planning concerning soils, species and biotopes, air quality and hydro systems. They know how to include environmental aspects in spatial planning and to assess environmental impacts of strategies and projects. They are aware and have gained skills in:

• ecological analysis methods (e.g. land suitability)
• how to use Models, computer tools and geographical information systems (GIS)
• and Environmental Impact Assessment

The students have first experiences in project exercises.

13. Inhalt:
A: Lecture “Ecological aspects of infrastructure planning” Introduction to the environment factors and goods: geological ressources, species and biotopes, ecosystem functioning, Air quality, hydro systems, impact of land use systems (especially agriculture and urbanisation, ecological landscape design. B: Seminar “Environmental impact assessment” In the seminar students have the task to prepare a presentation and a paper about:

• Structuring and evaluation of environmental impacts of strategies and projects
• Legislative aspects
• Modelling and evaluation methods
• Tools for impact modelling
• Case study examples

Alternatively the students work on case study exercises covering strategic regional and urban planning as well as road, housing, industrial, water, sports, tourism and other infrastructure projects

14. Literatur:
Information will be provided during the lectures Additional material can be downloaded from ILIAS

15. Lehrveranstaltungen und -formen:
• 505201 Vorlesung Ecological aspects of infrastructure planning
• 505202 Seminar Environmental impact assessment

16. Abschätzung Arbeitsaufwand: Sum 204 h
17. Prüfungsnummer/n und -name:  
  • 50521 Environmental Aspects (PL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0  
  • V Vorleistung (USL-V), schriftliche Prüfung  

18. Grundlage für ... :  

19. Medienform:  

20. Angeboten von:
Modul: 50170 Environmental Fluid Mechanics II

2. Modulkürzel: 021420013

3. Leistungspunkte: 6.0 LP
6. Turnus: jedes 2. Semester, SoSe
4. SWS: 5.0
7. Sprache: Englisch

8. Modulverantwortlicher: Univ.-Prof. Rainer Helmig

9. Dozenten: • Rainer Helmig
• Wolfgang Nowak

10. Zuordnung zum Curriculum in diesem Studiengang:
M.Sc. Water Resources Engineering and Management, PO 2012 ➔ Spezialisierungsmodule
M.Sc. Water Resources Engineering and Management, PO 2012 ➔ Zusatzmodule

11. Empfohlene Voraussetzungen: Recommended background knowledge:
Mechanics of incompressible and compressible fluids,
fundamentals of numerical methods in fluid mechanics,
fundamentals of exchange and transport processes in
technical and natural systems (e.g. groundwater and
surface water, pipelines).
Contents of Environmental Fluid Mechanics I

12. Lernziele: Students have the necessary grasp of hydrodynamic, physical and
chemical processes and systems to be able to answer environmentally
relevant questions concerning water and air quality in natural and
technical systems.

13. Inhalt: The lecture deals with the heat and mass budget of natural and
technical systems. This includes transport processes in lakes, rivers and
groundwater, heat and mass transfer processes between compartments
as well as between various phases (sorption, dissolution), conversion
of matter in aquatic systems and the quantitative description of these
processes. In addition to classical single fluid phase systems, multiphase
flow and transport processes in porous media will be considered. On the
basis of a comparison of single- and multiphase flow systems, the various
model concepts will be discussed and assessed.
In the accompanying exercises, example problems present applications,
extend the lecture material and help prepare for the exam. Computer
exercises improve the grasp of the problems and give insight into the
practical application of what has been learned.

14. Literatur: Lecture notes: Fluidmechanics II, Helmig

10. Zuordnung zum Curriculum in diesem Studiengang:
- M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Spezialisierungsmodule
- M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Zusatzmodule

11. Empfohlene Voraussetzungen:
- none (BAU), advisable LWW_Wabau
- none (UMW), advisable LWW_Gew
- Recommended background: Hydraulic Structures (WAREM)

12. Lernziele:
The students…
- are aware of the fact that flood protection is an integral process, based on different components (e.g. technical flood protection measures, prevention)
- know different strategies and examples of implementation for flood protection
- know about different procedure used worldwide in flood protection management
- know about the functionality of retention and protection structures: reservoirs, dams and dikes models
- are able to apply their knowledge on strategical planning and first design of engineering problems related to flood protection

13. Inhalt:
The module comprises the following topics:
- Introduction to flood control and flood control projects around the world
- Details on flood control projects and its evaluation based on world bank procedures.
- Flood control hydrological and hydraulic procedures.
- Procedures by US Army Corps of Engineers.
- Flood control economics
- World bank procedures and practice.
- Tsunami
- Occurrence, geophysics, different types of Tsunami. Case study on Aceh, Indonesia.
- Three Gorges dam flood control project in China
- The biggest flood control dam project explained in detail.
- The SMART Tunnel, Malaysia
- The biggest flood control tunnel and road way underground built for flood reduction and roadway. This mega project is fully operational.
- Flood Control Projects in UK and Netherlands
- Special Topics: Rainfall Harvesting, Invisible flood walls, Floating Breakwaters

14. Literatur:
Lecture notes and exercise material can be downloaded from the internet.
Hints are given for additional literature from the internet as well as libraries.

15. Lehrveranstaltungen und -formen: 501801 Lecture Flood Control: Evaluation and Case Studies
16. Abschätzung Arbeitsaufwand: 90h
17. Prüfungsnummer/n und -name:
   • 50181 Flood Control: Evaluation and Case Studies (BSL), schriftliche Prüfung, Gewichtung: 1.0, course achievements: written exam
   • V Vorleistung (USL-V), schriftliche Prüfung

  ➔ Zusatzmodule

11. Empfohlene Voraussetzungen: Modul Statistik und Informatik

12. Lernziele:  

13. Inhalt:  
  **Fuzzy-Logic:**  
  Um komplexe Prozesse und Zusammenhänge unserer Umwelt zu beschreiben und mögliche Folgen von Eingriffen abschätzen zu können, ist es notwendig, diese in mathematischen Modellen abzubilden. Fuzzy-Logik (oder Unscharfe-Logik) bietet einfache Werkzeuge, um derartige Modelle zu erstellen: Fuzzy-Sets, Membership Funktionen, Fuzzy Zahlen, Fuzzy Regeln

  **Operation Research:**

M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Zusatzmodule

11. Empfohlene Voraussetzungen: recommended background knowledge:
Contents of Geohydrological Modelling I+II

12. Lernziele:
Setup of Geohydrological Models for the purpose of heat transport
Specific properties of heat transport parameters
Pure Heat conductance (modflow)
Heat transport with the fluid in porous media (mt3d)
Equilibrium Approach and effective parameters
Nonequilibrium Approach with Dual Porosity
Boundaries and Initial Conditions
Spatial and temporal Discretization (Stability Criteria)

13. Inhalt:
Geohydrological Modelling III:
Theory of heat conductance and advective heat transport in porous media in thermal non- / equilibrium, Dual porosity approach, Adaption of heat parameters for calculation with modflow and mt3d, Calculation of non equilibrium heat conductance and transport with dual porosity approach,
Application examples: ground heat collector, geothermal energy probes, geothermal tests, hydrothermal configurations (monopol, dipole, multipol) and their application for heat extraction or storage

14. Literatur:
Script: J. Riegger ‘Geohydrological Modelling III’

➞ Chalmers -->Outgoing -->Wahlmodule

M.Sc. Water Resources Engineering and Management, PO 2012
➞ Spezialisierungsmodul

M.Sc. Water Resources Engineering and Management, PO 2012
➞ Zusatzmodule

11. Empfohlene Voraussetzungen:
Recommended background knowledge:
Geoengineering:
Basic knowledge of mechanics and groundwater flow
Geohydrology: Basic knowledge of groundwater hydraulics
Prerequisite module: none

12. Lernziele:

Geoengineering:
The students have the required skills to treat fundamental soil mechanics problems such as: groundwater flow, consolidation, slope stability, settlement and soil strength calculations.

Geohydrology:
The students have a strong foundation in the applied skills required to locate, analyse, assess, develop, and protect groundwater resources.

13. Inhalt:

Geoengineering:
This course includes information about the origin of soils and soil classification methods. It also includes the basics of groundwater flow as used in soil mechanics. Common geotechnical problems such as slope stability and soil consolidation are discussed and clarified. The stresses in soil, stiffness of soils and strength of soils are explained in details.

Geohydrology:
Covers the most important concepts of geology and hydrogeology; the interpretation of hydrogeological information from maps, aerial photographs, geophysical measurements and field data; the principles of groundwater development and the understanding of hydrogeological systems through case studies. A brief overview is given on the analysis of hydrochemical data and isotopes.

14. Literatur:

Geoengineering
Lecture notes can be downloaded from the Internet; PowerPoint presentations

Geohydrology:

Lecture notes can be downloaded from the Internet via the ILIAS system; PowerPoint presentations

Wichtig: mindestens ein konkreter Titel (Monographie, Artikel o.ä.) ist anzugeben

15. Lehrveranstaltungen und -formen:
   • 502101 Lecture Geoengineering
   • 502102 Lecture Geohydrology

16. Abschätzung Arbeitsaufwand:
   Geoengineering: 84h
   Geohydrology: 54h

17. Prüfungsnummer/n und -name:

11. Empfohlene Voraussetzungen:
Recommended background knowledge:
Technical Mechanics
Introduction to the mechanics of incompressible fluids
Higher Mathematics
Partial differential equations
Fluid Mechanics
Groundwater flow, allication of type-curves (Theis,..)

12. Lernziele:
Students know how groundwater resources are monitored and made accessible and how they should be protected to ensure sustainability with regard of other stakeholders within the catchment area
Qualification to start working in a water supply company or in the administration (dep. Water resources management) or consulting engineers

13. Inhalt:
Methods commonly used in practice for monitoring and exploring groundwater as well as making it accessible are presented. The contents are:
Function and operation of monitoring wells
Examples of bore hole geophysics
Monitoring networks, operation and optimisation
Building and operation of extraction wells (or well systems)
Vertical wells
Syphoning systems for water abstraction
Pumping tests (design, interpretation)
Conservation of evidence of impacts in environment (case study)
Practical application of numerical models for solving water management questions (case studies)
Environmental impact assessment for a groundwater extraction (case study)
Groundwater protection
Protection goals
Threats to groundwater
Water protection zones (purpose and demarcation)
Water pollution control and agriculture in water-supply areas
System analysis concerning groundwater management

Stand: 08. April 2015  Seite 65 von 118
Extraction optimisation taking the interests of the various stakeholders into account

11. Empfohlene Voraussetzungen:  
Recommended background knowledge:  
Hydrology, Hydrogeology, Fluid Mechanics

12. Lernziele:  
Field Course Hydrogeology:  
The students know the most common field investigations used in groundwater. This includes the relevant theoretical basics on groundwater hydraulics, hydrogeology and field methods. When applying theoretical knowledge on practical problems, the participants are able to recognise critical points and develop appropriate solutions.

Pumping Test Analysis  
The participants know the basic theories to analyse pumping tests and are able to use computer based methods like Spreadsheet Calculations for Analysis like Theis, Cooper-Jacob, Diagnostic Plots, Inverse Normalized Diagnostics, Recognition of Inner / Outer Boundaries, Heterogeneity, Well Effects and Handling of noise and trends.

13. Inhalt:  
Field Course Hydrogeology:  
In the field:  
• Soil Sampling / Drilling  
• Surveying / Levelling  
• Piezometric Heads / Potentiometric Surfaces  
• Pumping Test - Recovery Test  
• Piezometer test / Slug test  
• Tracer Test  
• Geophysical Borehole measurements / Natural groundwater velocity  
• Groundwater Chemistry  
• Hydrogeological Site Assessment

In the lab:  
• Column Experiments to Determine the Hydrodynamic Dispersion Coefficient and the Hydraulic Conductivity  
• Particle-Size Distribution and Soil Characterisation  
• Rocks: Definitions, Characterisation, Classification, Genesis, Hydraulic Properties

In the classroom:
• Theoretical background of the methods applied in the field and in the laboratory (see above)

**Pumping Test Analysis**

Basic theory and computer exercises to evaluate and analyse the pumping tests.
Analytical techniques, Diagnostic Plots, stationary / transient conditions, interior / outer boundary conditions, step-drawdown tests and Well Performance Tests, spatial distribution of parameters, regional parameters, effective parameters

## 11. Empfohlene Voraussetzungen:

Students will know how river ecosystems are functioning. Understanding natural processes is the basis for the assessment of changes in riverine ecosystems and for the development of mitigation measures. They get the basic knowledge about macrozoobenthos and fish fauna, with a focus on the species used in the CASiMiR model. Students will also get familiar with legislation on European level (WFD) and its national implementation.

They can analyse ecological impacts of hydropower driven changes in river systems. They know about the approaches to link requirements of water organisms with hydraulics. They have the skills to translate sampling data into habitat requirement data needed for habitat simulations. They are able to use modeling tools to quantify modifications in the amount and quality of riverine habitats. They are able to do basic assessments of these modifications.

## 13. Inhalt:

### River ecosystems

- Introduction to limnology
- Large Rivers: Volga & Danube
- Macrozoobenthos: Biology, demands of indicator species
- Fish: Biology, migration
- Legislation: European WFD, implementation and targets

### Hydropower: Environmental Impacts and mitigation

- Types of HPPs
- Ecological flow
- “Fish ladders”
- Approaches for the description of habitats
- Fuzzy-rule based modelling
- Minimum flow and methods for assessment
Attraction flow and hydraulic investigation of migration facilities

**Ecohydraulic Investigations**

Ecohydraulics and environmental hydraulics

Linkages between structural, hydraulic, and biological parameters

Hydronumeric modelling in low and average flow situations

Approaches for the description of habitats

Fuzzy-rule based modelling

Minimum flow and methods for assessment

Attraction flow and hydraulic investigation of migration facilities

Morphological enhancements and model based assessment

11. Empfohlene Voraussetzungen: none (BAU), advisable LWW_Wabau none (UMW), advisable LWW_Gew Hydraulic Structures (WAREM)

12. Lernziele:

**River Engineering and Sediment Management**
The students...

- are aware of rivers must be regarded and managed based on an integrated approach
- know the basic concept of the European Water Framework Directive (WFD) and the German legal framework for river basin management
- are able to analyze and estimate the consequences of the WFD based inventory for future management
- are aware of sediment transport processes and of the complexity of the interactions and relations
- recognize the possibilities and limitations of sediment managements strategies

**Integrated Flood Protection Measures**
The students...

- are aware of the fact that flood protection is an integral process, based on different components (e.g. technical flood protection measures, prevention)
- know the basic physical processes: dynamics of flood events, calculation of discharges and water depths, flood wave propagation; functionality of retention and protection structures: reservoirs, dams and dikes
- know 1-D and 2-D numerical hydro-dynamic models
- are able to apply their knowledge on practical engineering problems related to flood protection

13. Inhalt:
The module consists of two lectures:

**River Engineering and Sediment Management**
- Basic approaches of river basin management (legal framework)
• Systematics and results of basic inventory due to the WFD
• Anthropogenic impacts on river basins
• Origin of sediments and fundamental principles of transport
• Sediment management measures on different scales

**Integrated Flood Protection Measures**

• Socio-economic aspects of flood damage
• Calculation of water depths
• Hydro-dynamic flood wave calculation, Saint Venant-equation
• Technical flood protection measures
• Design and operation of retention basins
• Set-up of damage and risk maps, design of overtopping earthen dams and dikes
• Probability of failure, reliability calculation, flood risk management

14. **Literatur:**
Lecture notes and exercise material can be downloaded from the internet.
Hints are given for additional literature from the internet as well as libraries.

11. Empfohlene Voraussetzungen: Recommended background knowledge: Basic knowledge of hydrology and geohydrology  
Prerequisite module: none

12. Lernziele:

**Hydrological Modeling:**  
Construction of models for each part in the runoff process and how these models are used and integrated in different environment management systems.  
**Integrated model systems for the groundwater management:**  
Design of hydrogeological databases, visualization of data, GIS-Operations for the groundwater and hydrological modeling, Geostatistic, stochastic modeling, Monte Carlo Methods.

13. Inhalt:

**Hydrological Modeling:**  
What happens to the rain? This is the basic question that needs to be addressed in order to predict the amount of discharge at a certain location in a river system at a given time. Which parts of the fate of rainfall can be determined on a physical basis, and which are still left to empirical searching? Beside the qualitative determination of e.g. the processes of evapotranspiration, infiltration, interflow etc. we also need to describe the quantities of these processes to be able to forecast e.g. flood events.  
Hydrological watershed modelling is fundamental to integrated water management. There are complex interactions between the elements of the environmental continuum. In order to predict future behaviour and to quantify effects of management changes, quantitative mathematical descriptions are needed. A number of advanced hydrological watershed models have been developed in the last 30 years. A few of them will be reviewed in terms of their data needs and there predictive power. The participants are encouraged to form groups and to use their selected models for the same catchment so that the different approaches are compared.
Integrated model systems for the groundwater management:
Modern integrated model systems require techniques for the efficient construction of ground water models and their integration in “Decision Support Systems” as well as strategies for the handling of uncertainties. The course will discuss the specific “GIS-Methods” that are important for the integrations of databases, the visualization of data and the calculation of spatial data like ground water recharge. Special focus is laid on GIS supported hydrological modeling of the ground water recharge and the runoff parameters as well as adequate choice of the hydrological model concepts for the calculation of the local water balance in different data situations. To handle the model uncertainties, geostatistic methods and associated stochastic modeling attempts like the “Monte Carlo Simulation” will be mentioned.

9. Dozenten: Sabine-Ulrike Gerbersdorf

11. Empfohlene Voraussetzungen:

12. Lernziele: Knowledge on Limnology, Hydrobiology and Limnic Ecology is essential to analyse the present state of the aquatic habitat, to predict the impact of construction activity on organisms and habitat functions, and if necessary, to act with the right “cure” to re-establish ecosystem health and important ecosystem services of freshwater habitats. Freshwater ecosystems drive important functions, reaching from provisioning (e.g. food, clean drinking water), regulating (e.g. carbon sequestration, self-purification) to supporting (e.g. biogeochemical fluxes) services.

Lecture I “Basics of Limnic Ecology”
The student knows about physical (e.g. light, temperature, flow regime) and chemical (e.g. pH, oxygen, nutrients) parameters determining the freshwater environment to impact the inhabiting organisms. He/She got an overview on the prevalent and important species in the pelagic, benthic and littoral zone and on their metabolic activities and functions; ranging from primary producers (microalgae, macrophytes) to secondary producers and consumers (bacteria, protozoa, metazoa). The student is able to explain trophic relationships (e.g. microbial loop, food webs), importance of leading organisms (e.g. Saprobic Index) and species richness/biodiversity for indicating and maintaining water quality. He/She is familiar with challenges for health and safety of water bodies / drinking water as well as self-purification within aquatic systems with regard to eutrophication, human impacts in a wider sense as well as “natural” toxic algae blooms. The student knows about the ecological resilience of water bodies and strategies of biomanipulation, decontamination up to restoration measures to support the natural regeneration potential of aquatic systems.

Seminar “Selected topics in Limnic Ecology”
The student knows how to present research to an audience by practising and improving important presentation skills (“soft skills”) in response to appropriate feedback. He/she has acquired extensive knowledge in a selected topic of Limnic Ecology by choosing his/her presentation. The students got an insight in the research and work of external lecturer that are specialized in areas related to Limnic Ecology.

This lecture gives insights into the interactions between freshwater bodies and their inhabiting organisms (“ecology”) to affect the ecosystem services of aquatic habitats, ranging from groundwater, streams, rivers, lakes to drinking reservoirs.
Basic definitions and classifications schemes for a range of aquatic habitats; differences in lotic and lentic water bodies
Abiotic factors and their impact on organisms and habitat: light, temperature, flow regime/turbulence, wind, water level, chemical factors, pH, conductivity, oxygen and nutrients
Main “actors” from the pelagic (phytoplankton, zooplankton), the benthic (meiofauna, macrofauna, weed) and the riparian (reed, macrophytes) zone and their main features and functions
Biotic factors such as competition, prey-predator relations, engineering, primary and secondary production as well as decomposition
Ecosystem functions such as nutrient recycling, self-purification, food webs, engineering
Challenges for health and safety of water bodies: natural (toxic algae) to human (eutrophication) impacts
Strategies to re-establish or support ecological balance (is there an ecological balance?): Remediation, Restoration, Renaturation

Seminar “Selected topics in Limnic Ecology”

This seminar will give extensive knowledge on selected topics related to Limnic Ecology, according to the choice of the students. Potential topics are biofouling, neophyte/neozoa, toxic algal blooms, noxious weed, parasites, climate change impacts

   • Richard Junesch
   • Marion Aschmann

10. Zuordnung zum Curriculum in diesem Studiengang:
    M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Spezialisierungsmodule
    M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Zusatzmodule

11. Empfohlene Voraussetzungen:

12. Lernziele: The students understand techniques for dealing with complex decision situations and gain insights in the decision-analysis process for both public and private decision-making with all related steps. Social aspects that may influence planning process or outcome will also be discussed. The students are acquainted with fundamental notions of demography as far as urban and regional planning is concerned. The students are able to apply basic methods of demographic analysis and forecasting.

13. Inhalt: The module consists of two courses: The lecture "Decision Analysis" will cover the following subjects:

   • Elements of Decision Problems
   • Structuring Decisions
   • Generating Objectives and Hierarchies
   • Generating Alternatives
   • Decision Making with Multiple Objectives
   • Risk and Uncertainty in Decision Situations
   • Collective Decision Making
   • Application to Infrastructure Planning

   The course "Demographic Analysis and Forecasting" will provide an overview of the most frequently appearing issues of demographic analysis and forecasting. It will consist of three main parts: Fundamental notions of (applied) demography and some of the methodical/conceptual problems linked with these notions. Selected fundamental approaches to analysing and forecasting natural growth (or decline) of population, will be presented and discussed critically. Examples of such analyses and forecasts will be calculated. Migration, as the most critical and most important aspect of population development under regional aspects, will constitute the main topic of the third part. Basic methods of analysing and forecasting migration will be presented and discussed with regard to their application on concrete cases.

10. Zuordnung zum Curriculum in diesem Studiengang:

- M.Sc. Water Resources Engineering and Management, PO 2012 ➔ Spezialisierungsmodul
- M.Sc. Water Resources Engineering and Management, PO 2012 ➔ Zusatzmodule

11. Empfohlene Voraussetzungen:

- Knowledge in Sanitary Engineering, Water Supply and Hydraulics
- Contents of Water and Power Supply

12. Lernziele: The students...

- Can plan and design centralised water supply systems as part of rural and urban infrastructure.
- Can calculate dimensions of all elements of centralised water supply systems.
- Can calculate costs of all elements of centralised water supply systems.
- Have an idea of relations between water, politics, social changes and influences on environment and planning process.
- Can design in detail all elements of centralised water supply systems.

13. Inhalt:

- Planning process as function of topographical, economical, social, environmental boundaries.
- Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods.
- Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas, details of planning and design.
- Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems, details of planning and design.
- Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters, details of planning and design.
- Water storage: necessity, types and functions of tanks, water towers and reservoirs, details of planning and design.
- Cost calculation: Cost functions for different facilities, Calculation process, calculation of water tariff.

(Special focus is laid upon long-term-aspects (operation and maintenance and organization of project executing agency)).

13. Inhalt:
    A: Project Planning and Appraisal (SS)
    Comprehensive introduction into planning and appraisal of infrastructure projects
    Presentation and discussion will include:
    • importance of pre-screening, prefeasibility and feasibility studies
    • project appraisal (financial analysis)
    • project appraisal (economic cost benefit analysis)
    • evaluation of project alternatives
    • financial viability of projects
    • 2 case studies based on existing feasibility studies prepared for KfW
    • Logframe analysis (tool for consistent planning and risk coverage).
    (Will be presented in WS).
    
    B: Project Financing, Implementation and Final Evaluation (WS)
    Comprehensive introduction into financing, implementation, monitoring, and final evaluation of infrastructure projects
    Subject Description:
    • requirements of external financing
    • external and internal sources of financing
    • Private sector participation for project financing and operation (BOT models)
    • Private sector participation for operation and maintenance
    • important steps of project implementation (implementation consultant, terms of reference, tender, contract of goods and services)
    • supervision, monitoring, disbursement of funds
    • final evaluation

14. Literatur:

9. Dozenten: Andreas Hutarew

M.Sc. Water Resources Engineering and Management, PO 2012 → Zusatzmodule

11. Empfohlene Voraussetzungen: Recommended background knowledge: Basics in environmental, engineering, hydraulic structures, finance and legal administration instruments

12. Lernziele: Student is able to follow up necessary legal and administrative procedures. He understands the relation and communication necessities between the concerned faculties, parties and interest in a project. Student is able to rule the process of carrying out the project during the stages approval, financing execution and final operation

13. Inhalt: PROJECT PREPARATION, MANAGEMENT AND FINANCE:
Design criteria techno-financial - Legal procedures and clearances. Influencing aspects and basic needs and techniques in project preparation
Civil - Steel structures - Mechanical - Electrical - Communication Feasibility - Detailed Project report - Execution design Interaction - Management - Start up - Acceptance approvals Onsite performance - Environmental management - Groundwater relevance Relationship Authorities - Owner - Suppliers - consultant - Financing institutions Operation - Lab diagnostics - Applied computing Conflict and dispute management techniques

DEALING WITH WATER ENDANGERING SUBSTANCES:
Contents. Why do we need a principle of concern Legal background procedures and clearances. Influencing aspects and basic needs and techniques in environmental hazard Preventive civil and communication solutions Interaction - Management - Documentation - Acceptance approvals Onsite performance - Environmental, groundwater, soil and air relevance Relationship Authorities - operator - advisor - authorization principles Conflict and dispute management sequences

PRACTICAL WORK, Dr. Andreas Hutarew PPaM & VAwS
Contents. selection of ongoing project sites, used for teaching Project locations PPaM & VAwS:
Hydro power stations Rottenburg / Neckar Nuclear power station Phillipsburg / Rhein Pumping station HEP Kostheim / Main Hydro power stations Altenburg / Neckar Lectures take partly place on projects sites and will last till early evening

Stand: 08. April 2015

11. Empfohlene Voraussetzungen:

12. Lernziele:
The students understand the major challenges, objectives, strategies and instruments in spatial planning and urban development in Europe as well as in developing countries. The students are acquainted with the legal framework of comprehensive and sector planning and know the capabilities and limits of public planning as “positive” and “negative” planning.

13. Inhalt:
The course Regional Planning I covers the following topics:
   • Overview on current planning issues
   • Basic Terms of Spatial Planning
   • Strategies in Spatial Planning
   • Instruments of Spatial Planning
   • Performance of Plans, Assessing Plans

The course Urban Planning I provides an overview on the origin of planned urban development, starting in Greece and the Roman Empire, passing through all important periods up to the 21st century. The second part introduces urbanisation processes in third world countries, planned and unplanned urban conglomerations, including Mega Cities and Global Cities.

| 11. Empfohlene Voraussetzungen: | prerequisite modules: Regional and Urban Planning I |
| 12. Lernziele: | The students are acquainted with basic methods of analysis and assessment in spatial planning. The students are able to cope with function, prerequisites and methodical problems of the methods presented. The lectures demonstrate the usage of planning instruments and methods based on planning cases from Germany and other countries. |
| 13. Inhalt: | The course Regional Planning II deals with the following planning methods:  
• Indicator-based monitoring and evaluation methods  
• Multi-criteria decision analysis (e.g. cost-benefit analysis, utility value analysis, analytic hierarchy process)  
• Methods of impact assessment  
• Techniques of demand forecast and land suitability analysis  
• Hazard and vulnerability analysis (climate change adaptation)  

The course Urban Planning II gives an overview on:  
• Levels of spatial planning in urban areas  
• Urban development planning  
• Urban analysis  
• Urban renewal  
• Urban planning instruments  
• Land use planning and implementation planning  
• Legal framework |

Modul: 50340 Regional and Urban Planning III

2. Modulkürzel: 021100012  5. Moduldauer: 1 Semester
4. SWS: 4.0  7. Sprache: Englisch
8. Modulverantwortlicher: Univ.-Prof. Jörn Birkmann
9. Dozenten: • Anette Gangler
               • Stefan Fina
               • Anna Goris
10. Zuordnung zum Curriculum in diesem Studiengang:
    M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Spezialisierungsmodule
    M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Zusatzmodule
11. Empfohlene Voraussetzungen:

12. Lernziele: The students are able to analyze and present the development situation
and problems or some specific topics related to the development of
their own countries in a systematic way and to discuss development
situations and problems or specific topics of other countries. They
receive experience in analyzing, summarizing and presenting the aspects
mentioned above in English language.
The students are able to investigate housing standards and typologies
and the housing demand and supply.

will be conducted as a series of (a) lectures, (b) consultations and (c)
seminar meetings.
a) Lectures provide an overview of development history and current
issues concerning development policy and planning. Students will choose
a topic of interest within this context and propose an agenda and outline
for the self-study of this topic.
b) Additional lectures on academic writing and presentation
techniques as well as consultation hours will provide assistance for the
preparation of a scientific paper on this topic.
c) A conference program for seminar meetings will be set up for
authors to present their work in smaller groups (plenary sessions).
Students participating in a plenary session peer-review papers of
presenters and participate in the discussion.

The first part of the seminar Housing introduces housing typologies in
Europe and Middle East. In the second part, participants portray the
housing situation of their home countries with respect to typology, supply
and demand, self-help models and spontaneous settlement patterns.

M.Sc. Water Resources Engineering and Management, PO 2012 ➔ Zusatzmodule
11. Empfohlene Voraussetzungen: Prerequisite Modules:  
Sanitary Engineering  
Urban drainage and design of Wastewater treatment plants  
Chemistry and Biology for Environmental Engineers
12. Lernziele: The student knows and understands in theory and practice  
- the most important parameters to characterize water and waste water and the analytical methods to determine them (e.g. pH, nitrate, ammonium, phosphorus, alkalinity, acidity, permanganate index, conductivity, oxygen, loss of ignition, filterable matter).  
- important techniques for removal of water contaminants (e.g. ion exchange, precipitation, coagulation, sorption, neutralization, aerobic, anoxic and anaerobic degradation)  
- how to take representative samples out of the different waste streams and the relevant sampling errors  
The student is aware of the most important microbiological tools to detect, handle and use microorganisms in environmental engineering systems  
The student  
- is capable of interpreting and evaluating analytical data and based on these data to draw conclusions in order to evaluate the quality of water and the efficiency of processes for treatment of water and solid waste.  
- is able to apply the relevant laboratory test procedures to analyze compost within the quality assurance system and to interpret the results.  
- has the competence to develop a sampling procedure for household waste and to determine the waste composition by a sorting analyses  
- is able to apply selected test procedures in the field of hazardous waste and the analyses of odor samples
13. Inhalt: This course serves to the intensification of the theoretical knowledge in sanitary engineering by practical work in the laboratory and an accompanying student seminar. The experiments offered belong thematically to the three main areas:  
- water and waste water  
- solid waste  
- chemistry and microbiology  
The experiments are mainly performed directly by the students in groups of 3 to max. 6 or offered as demonstration experiments.

11. Empfohlene Voraussetzungen: Recommended background knowledge: Basic knowledge of statistics
    Prerequisite module: none

12. Lernziele: Concepts of Geostatistics:
    Knowledge of the basic geostatistical concepts, difference between
    Kriging and simulation, advantages and disadvantages of the discussed
    methods, application of Kriging and simulation
Stochastical Modeling:
    The participants have skills in basic statistical methods used in hydrology,
    like time series analysis, extreme value statistics, parameter estimation
    methods and statistical tests.

13. Inhalt: Concepts of Geostatistics:
    Geostatistical procedures for the interpolation of measured values,
    assessment of model parameters and planning of Measuring networks
    are dealt with.
    Contents:
    • Introduction
    • Statistical hypotheses: Basic concepts; Regionalized variables;
      Second order stationarity: Intrinsic hypothesis; Comparison of the two
      hypotheses; Selection of the regionalized variable
    • The variogram; The experimental variogram; The theoretical
      variogram; Variogram models; Variogram fitting; Isotropy — anisotropy
    • Ordinary Kriging: Point kriging; Block kriging; Properties of ordinary kr.;
      Kr.as an interpolator; Kr. and the variogram; Practice of kr.;Selection of
      the neighbourhood; Kr. with a "false" variogram; Cross validation; Kr.
      with uncertain data; Simple Kr.
    • Non stationary methods: Universal kr.;Intrinsic random functions of
      order k; External-Drift-Kr.
    • Indicator Kriging: Indicator Kriging; Applications
    • Kriging with arbitrary additional information: Markov-Bayes-Kriging;
      Simple Updating (SU)
    • Time dependent variables
    • Simulations: Basic definitions; Monte Carlo; Turning Band;
      Unconditional simulation; Conditional simulation; Sequential
Simulation; Simulation using Markov Chains; The Hastings Algorithm; Simulated annealing; Indicator Simulation; Truncated-Gaussian Simulation; Application of simulations

- Exercises

**Stochastical Modeling:**
The lecture part stochastic modeling is primarily concerned with the stochastic analysis of temporal and areal arrays, their generation and their use in the hydrological modeling. Calculation and analysis of hydrological data, descriptive statistic and their parameters, possibility analysis, correlation and regression, time series analysis and simulation.

Content:

- Univariate Statistics and multivariate Statistics (e.g. regression analysis)
- theory of probabilities
- random variables and probability functions (e.g. Poission distribution)
- estimation of parameters (e.g. Maximum Likelihood Method)
- statistical tests (e.g. Kolmogorov-Smirnov test)
- extreme value statistics (analysis of the frequency of occurrence of floods)
- time series analysis (e.g.. ARMA Models)
- stochastic simulations (Monte-Carlo Methods)

11. Empfohlene Voraussetzungen:  
Chemistry and Biology for Environmental Engineers  
Sanitary Engineering

12. Lernziele:  
Advanced knowledge of processes and concepts for urban drainage and municipal wastewater treatment systems  
Basics of construction and dimensioning of different urban drainage systems, stormwater treatment facilities and wastewater treatment plants as a base for dimensioning and discussion of proved and innovative technologies  
Deeper understanding for system connections as base for decisions during the planning process

13. Inhalt:  
Design of sewer systems and stormwater treatment  
(Dr.- Ing. Ulrich Dittmer)

- principles of collection and disposal  
- design of combined and separate sewer systems  
- Sustainable urban drainage systems (SUDS) and low impact design(LID)  
- Application of rainfall runoff models (computer exercise using U.S. EPA Stormwater Management Model)  
- different techniques for treatment and retention  
- design of treatment facilities  
- Design of wastewater treatment plants (Prof. Dr.-Ing. Heidrun Steinmetz)

- Municipal wastewater treatment  
  different techniques for advanced biological wastewater treatment (nitrogen and phosphorous removal)
principles of process engineering
design of biological wastewater treatment plants and the main important aggregates
design of sludge treatment plants

Seminar: feasibility studies
(Prof. Dr.-Ing. Heidrun Steinmetz and external consultants)
special examples for sanitation concepts for world wide application
Ecological sanitation and resource orientated systems
case studies

M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Vertiefungsmodule ➞ Vertiefungsmodule Wahlpflicht

M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Zusatzmodule
11. Empfohlene Voraussetzungen: Knowledge in Sanitary Engineering, Water Supply and Hydraulics
Contents of Water and Power Supply
12. Lernziele:
• The students learn how to characterize and protect water bodies as well as to improve the water quality
• Students understand the contribution of wastewater treatment to the preventive protection of receiving waters and they learn the basic methods of water quality management instruments
• Students understand the necessity of water treatment as essential element of drinking water supply
• Students learn the chemical, physical and biological background of water treatment technologies, their possibilities and boundaries and they are able to develop, design and dimension treatment schemes for different raw water qualities
13. Inhalt:

Water Quality Management:
• Terms and introduction: environmental data from Germany
• Characterisation and assessment of flowing waters, stagnant waters and groundwater
• Water quality parameters, WHO drinking water guidelines, targets for drinking water and sanitation, description of water quality in relation to use
• Improvement of water quality, reduction of pollution load, point pollutants and diffuse loads, improving the self-purification capacity of waters, technical helps, assessment of progress
• Water quality management; the European Union Framework Directive; quality planning and maintenance, monitoring networks

Water Treatment:
• Water supply and water treatment: basic requirements, drinking water standards
• Mechanical treatment: Screening, Sieving, Sedimentation, (Membrane)Filtration, Gas-Exchange, Flotation
• Carbondioxide-Carbonate-Balance: relevance, chemical background
• Deacidification: mechanical and chemical methods
• Removal of iron, manganese and arsenic: methods
• Decarbonization: chemical methods
• Flocculation
• Adsorption
• Disinfection: chemical and physical methods

14. Literatur: Lecture notes and material for exercises will be provided during the lecture. Hints are given for additional literature from the internet as well as libraries, e.g.

Private study: ca. 138 h

1) Lecture: presence time = 34,0; self study = 106,0; Sum = 140,0
2) Exercise: presence time = 8,0; self study = 32,0; Sum = 40,0
Sum Lecture (140) + Sum Exercise (40) = 180,0

17. Prüfungsnummer/n und -name:
- 19361 Water Quality and Treatment (PL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0

18. Grundlage für ... :

19. Medienform:

20. Angeboten von: Siedlungswasserwirtschaft und Wasserrecycling
Modul: 50350 Water Resources and Irrigation - Planning Methods and Tools

4. SWS: 6.0 7. Sprache: Englisch

8. Modulverantwortlicher: Kristina Terheiden

9. Dozenten: • Jochen Seidel  • Kristina Terheiden

10. Zuordnung zum Curriculum in diesem Studiengang:
   M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Spezialisierungsmodule
   M.Sc. Water Resources Engineering and Management, PO 2012 ➞ Zusatzmodule

11. Empfohlene Voraussetzungen:

12. Lernziele: Students know about crop water demand and supply, conservation of soil quality and, in this context, about decision making as well as planning and design processes.

   Irrigation Issues (Terheiden): Students have theoretical and practical back ground knowledge of irrigation and soil conservation issues.

   Computer Applications in Water Engineering (Terheiden): Students know how to apply computer programs related to irrigation- and river basin-management.

   Multi Objective Decision Making in Water Resources Management (Seidel): Students are able to apply various decision making methods and are able to use them for the appraisal of large projects such as irrigation schemes and/or river training works

13. Inhalt:

   Water Management and Irrigation Facilities:
   • Water demand, scarcity and availability
   • Assessment of crop water demand
   • Irrigation facilities
   • Health hazards of irrigation facilities
   • Soil erosion and salinization

   Computer Applications in Water Engineering:
   Theory and application of computer programs such as
   • SimResSedim: Water and sediment balance of reservoirs
   • Sahel: Interaction between socio-economic human activities and water- and land-resources of the used area
   • Wasim: Water and salt balance in soils
   • Wepp: Water Erosion of crop- and natural land
   • Cropwat: Crop water requirements and irrigation scheduling
   • Hec-Ras, Mike11, Hydro_As 2D: One- and two-dimensional hydrodynamic modeling of river systems

   Multi Objective Decision Making in Water Resources Management:
   The use of evaluation and decision making methods in order to determine long term effects on planned actions will be addressed. Registration,
quantification and evaluation of project alternatives using different methods and techniques are focused:

- Cost comparison method
- Linear Programming
- Multi Objective Decision Making methods, e.g. Composite Programming, ELECTRE, MCQA
- Case study using Composite Programming
- Introduction to Game Theory and Conflict Analysis

14. Literatur:
Lecture notes to

- 'Irrigation Issues' authored by W.Marx

will be provided on the e-learning Ilias-platform for downloading. Specific material will be distributed during lectures/exercises

15. Lehrveranstaltungen und -formen:
- 503501 Lecture Water Management and Irrigation Facilities
- 503502 Lecture Computer Applications in Water Engineering
- 503503 Lecture Multi Objective Decision Making in Water Resources Management

16. Abschätzung Arbeitsaufwand:
Sum 180h

17. Prüfungsnummer/n und -name:
50351 Water Resources and Irrigation - Planning Methods and Tools (PL), schriftliche Prüfung, 180 Min., Gewichtung: 1.0

18. Grundlage für ... :

19. Medienform:

20. Angeboten von:
Modul: 15160 Water and Power Supply

2. Modulkürzel: 021410105 5. Modulduauer: 1 Semester
4. SWS: 0.0 7. Sprache: Englisch

8. Modulverantwortlicher: Markus Noack
9. Dozenten: • Ralf Minke
               • Markus Noack

    ➔ Zusatzmodule

11. Empfohlene Voraussetzungen: None

12. Lernziele:

   **Power Demand, Supply and Distribution:**
   The students…
   • know the German, European and worldwide energy markets related to demand, supply and its distribution capabilities
   • are aware of that non-renewable energy sources are strictly limited and time-scales for conversion of energy markets long
   • have an idea about the relations between energy, politics, social changes and influences on environment
   • have a basic knowledge about present energy conversion systems, theoretical limits of efficiencies, and the potential to enhance applied technology
   • have a basic understanding about where and how energy is provided and distributed
   • comprehend the balance between load and supply in electrical grids and the resulting necessity for control energy.

   **Water Demand, Supply and Distribution:**
   The students…
   • know the German and worldwide water systems related to demand, supply and its distribution capabilities
   • have an overview on the water supply situation all over the world.
   • recognize the different possibilities and levels of water supply
   • have an idea of the relations between water, politics, social changes and influences on environment.

13. Inhalt:

   **Power Demand, Supply and Distribution:**
• Energy demand, energy supply
• Energy generation
  - overview of different types of power plants
  - renewable energy
  - thermal power plants (conventional and nuclear)
• Areas of application of different power plants
• Emission control techniques
• Cooling of thermal power plants
  - methods
  - water resources aspects
• Energy transport and energy storage
• Net techniques
• Energy market
  - trade
  - politics
  - law
• social changes due to energy supply

Water Demand, Supply and Distribution:
• Water supply and water distribution: necessity, basic requirements, elements, hydrological cycle
• Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods
• Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas
• Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems.
• Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters
• Water storage: necessity, types and functions of tanks and reservoirs
• Case study: planning and design of a water supply system for a small town

14. Literatur: Lecture notes can be downloaded from the internet. Hints are given for additional literature from the internet as well as libraries.

15. Lehrveranstaltungen und -formen:
• 151601 Vorlesung Energy Demand, Supply and Distribution
• 151602 Vorlesung Water Demand, Supply and Distribution

16. Abschätzung Arbeitsaufwand:
Time of attendance: 45 h
Private Study: 135 h

17. Prüfungsnummer/n und -name:
15161 Water and Power Supply (PL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0

changer --> Incoming

DoubleM.D. Water Resources Engineering and Management, PO 2012
changer --> Incoming

M.Sc. Water Resources Engineering and Management, PO 2012

11. Empfohlene Voraussetzungen:
The topic of the Master Thesis can be handed out only the moment at least 78 credit points have been acquired already by the candidate. One month after 90 credit points have been acquired the candidate is supposed to start the work on his master thesis or to ask for the assignment of the topic at the latest.

12. Lernziele:
Capability to implement an independently composed project schedule for the treatment of a recent scientific problem in an international research environment.
Effective scientific work in a team, enforcement of strategies internally and particularly externally. Acquire the necessary stamina to not be discouraged by unexpected problems and throwbacks in scientific projects and to finally be successful by the formulation of alternative methods of resolution.
Multidisciplinarity through contacts with representatives of other fields like Chemistry, Mathematics, Informatics, etc.
Obtaining the capability to discuss the own results of research in the environment of the recent international research comprehensively and to represent them in written (Master’s Thesis) and oral (talk) form.

13. Inhalt:
Treatment of a recent scientific problem in an international research environment.
The successful treatment of the scientific problem requires the specialisation in the related field of research and the acquisition of the necessary knowledge.

14. Literatur:
Recent literature on the topic of the scientific problem

16. Abschätzung Arbeitsaufwand: 900 h (Contact time: 900 h)
