Modul: 50090 Environmental Fluid Mechanics I

2. Modulkürzel: 021420012 5. Modulduer: 1 Semester

4. SWS: 5.0 7. Sprache: Englisch

8. Modulverantwortlicher: Apl. Prof. Holger Class

9. Dozenten:
• Jürgen Braun
• Holger Class
• Sergey Oladyshkin

10. Zuordnung zum Curriculum in diesem Studiengang:
- DoubleM.D. Water Resources Engineering and Management
  ➞ Chalmers -->Incoming -->Semi-Compulsory Modules
  ➞ DoubleM.D. Water Resources Engineering and Management
  ➞ Chalmers -->Outgoing -->Pflichtmodule
  ➞ DoubleM.D. Water Resources Engineering and Management
  ➞ Mara -->Incoming -->Compulsory Modules
  ➞ DoubleM.D. Water Resources Engineering and Management
  ➞ Mara -->Outgoing -->Pflichtmodule
  ➞ M.Sc. Water Resources Engineering and Management
  ➞ Vertiefungsmodule -->Vertiefungsmodule Pflicht

11. Empfohlene Voraussetzungen:
- Technical Mechanics
  • Introduction to the statics of rigid bodies
  • Introduction to elastostatics
  • Introduction to the mechanics of incompressible fluids

- Higher Mathematics
  • Partial differential equations
  • Vector analysis
  • Numerical integration

- Fundamentals of Flow Mechanics
  • Conservation equations for mass, momentum, energy
  • Navier-Stokes, Euler, Reynolds, Bernoulli equation

12. Lernziele:
Students have fundamental knowledge of flow in various natural hydrosystems and its application in civil and environmental engineering.

13. Inhalt:
The lecture deals with flow in natural hydrosystems with particular emphasis on groundwater / seepage flow and on flow in surface water / open channels. Groundwater hydraulics includes flow in confined, semi-confined and unconfined groundwater aquifers, wells, pumping tests and other hydraulic investigation methods for exploring groundwater aquifers. In addition, questions concerning regional groundwater management (z.B. recharge, unsaturated zone, saltwater intrusion) are discussed. Using the example of groundwater flow, fundamentals of CFD (Computational Fluid Dynamics) are explained, particularly the numerical discretisation techniques finite volume and finite difference. The
Hydraulics of surface water deals with shallow water equations / Saint Venant equations, unstationary channel flow, turbulence and layered systems. Calculation methods such as the methods of characteristics are explained. The contents are:

- Potential flow and groundwater flow
- Computational Fluid Dynamics
- Shallow water equations for surface water
- Characteristic method
- Examples from civil and environmental engineering

### 14. Literatur:

Modul: 19330 Industrial Waste Water

2. Modulkürzel: 021210151
3. Leistungspunkte: 6.0 LP
4. SWS: 4.0
5. Moduldaeu: 1 Semester
7. Sprache: Englisch
8. Modulverantwortlicher: Prof./Uni.Reg.deBlumenau Uwe Menzel
9. Dozenten: • Uwe Menzel
     • Michael Koch
10. Zuordnung zum Curriculum in diesem Studiengang:
     DoubleM.D. Water Resources Engineering and Management
     → Chalmers -->Incoming -->Semi-Compulsory Modules
     DoubleM.D. Water Resources Engineering and Management
     → Mara -->Incoming -->Compulsory Modules
     M.Sc. Water Resources Engineering and Management
     → Spezialisierungsmodule
     M.Sc. Water Resources Engineering and Management
     → Zusatzmodule
11. Empfohlene Voraussetzungen:
12. Lernziele: Students have:
     • a basic understanding for the problems and requirements of industrial waste water treatment
     • an overview of measures for production integrated environmental protection, relevant treatment methods for process water and its characterization
     • an overview of water analysis including sampling, the main principles of different analytical techniques and the ways to assure the quality of chemical analysis
13. Inhalt: Fundamentals of industrial waste water treatment Determiniation of current situation possible process integrated measures measures for reuse and recirculation of water mass and concentration balance Basic elements and examples for applications to the advanced purification processes: biological waste water treatment Sampling and analytical techniques using: onsite measurements oxidation - reduction acids and bases sum parameters photometry spectrometry chromatography Analytical quality assurance
15. Lehrveranstaltungen und -formen:
     • 193301 Lecture Treatment of Industrial Waste Water
     • 193302 Lecture Water Analysis and Analytical Quality Control
16. Abschätzung Arbeitsaufwand: Time of attendance:

I Treatment of Industrial Waste Water: 2 SWS = 24 hours
II Water Analysis and Analytical Quality Control: 2 SWS = 24 hours
Exam: 2 hours
sum of attendance: 50 hours
self-study: 130 hours
**total: 180 hours**

17. Prüfungsnummer/n und -name: 19331 *Industrial Waste Water (PL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0*

18. Grundlage für ...:

19. Medienform: power-point-presentation, blackboard and over-head projector

20. Angeboten von: Siedlungswasserwirtschaft und Wasserrecycling
Modul: 55980 Seminar Module

2. Modulkürzel: [pord.modulcode]  
5. Moduldauer: 1 Semester

3. Leistungspunkte: 3.0 LP  
6. Turnus: jedes Semester

4. SWS: 2.0  
7. Sprache: Englisch

8. Modulverantwortlicher: Anne Weiß

9. Dozenten:

11. Empfohlene Voraussetzungen:

12. Lernziele: Capability to summarize a water-related topic or the investigations of a scientific, water related problem in terms of two 20 min presentations, discussion on the topic after presenting.

Ability to participate in a scientific discussion, asking questions to presenters.

Writing a summary of a visit at a technical site, condense information to a short report.

13. Inhalt: Treatment of a water related topic or a recent scientific problem in an international research environment.

The successful treatment of the scientific problem requires the specialisation in the related field of research and the acquisition of the necessary knowledge.

Week-end workshop regarding presentation techniques. This course covers the basics of presentation structure, layout, voice and body language as it relates to presentation delivery. The aim is to provide students with means to give lively and effective presentations

Course: Correct Citation in scientific papers. The students will know about the importance of correct citations, see different types of citations and learn formal ways to make citations visible and comprehensible.

14. Literatur: Recent literature on the water related topic/ scientific problem

15. Lehrveranstaltungen und -formen:

16. Abschätzung Arbeitsaufwand: 90h (contact time 70h)

17. Prüfungsnummer/n und -name: 55981 Seminar Module (BSL), Sonstiges, Gewichtung: 1.0, Course achievements: Compulsory attendance in: seminar, workshop "presentation techniques", course "Correct Citation in scientific papers", excursions. Two presentations, one written short report (USL)

11. Empfohlene Voraussetzungen:

12. Lernziele:

**Lecture: Inorganic Chemistry**

The students

- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

**Lecture: Organic Chemistry**

The students

- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions
- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

**Lecture: Biology and ecology of water, soil and air systems**

The students
- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries
- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations
- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.
- know important events and scientists in the history of biology
- know basics in ecology of natural and artificial ('technical') ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

**Lecture: Technical and medical microbiology for engineers**

The students
- know the most important microorganisms being active in plants treating waste water, air and contaminated soil
- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass
- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these
plants; this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

Lecture: Inorganic chemistry

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
- chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
- quantitative Relationships and Stoichiometric Equations
- characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
- descriptive part: selected chemical compounds and their preparation and properties

Lecture: Organic chemistry

- functional groups and compound classes
- classification of chemical reactions in organic chemistry
- organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
- chemical and microbial degradation of organic matter in the environment
- summary parameters
- organic environmental contaminants

Lecture: Biology and ecology of water, soil and air systems

The following topics are presented within the lecture:

- Introduction in history of microbiology
- Important waterbased/water related diseases
- Function of microscopy of staining techniques
- Structure and function of prokaryotic cells
- Structure and function of eucaryotic cells
- Necessity and effects of microbial nutrition
- Microbial growth relations and possible limitations
- Microbial metabolism: Energy production, conservation and release
- Microbial metabolism: Enzymes synthseses and regulation.

Lecture: Technical and medical microbiology for engineers

- Important (sewage) water based /water related diseases/detection and possible countermeasures
- Important soil and air connected diseases
- (micro)biological principles in application of engineering techniques
• Implication of engineer work on ecosystems /environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

11. Empfohlene Voraussetzungen:

12. Lernziele:

**Lecture: Inorganic chemistry**

The students

- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

**Lecture: Organic chemistry**

The students

- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions
- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

Lecture: Biology and ecology of water, soil and air systems

The students
- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries
- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations
- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.
- know important events and scientists in the history of biology
- know basics in ecology of natural and artificial ('technical') ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

Lecture: Technical and medical microbiology for engineers

The students
- know the most important microorganisms being active in plants treating waste water, air and contaminated soil
- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass
- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these
plants; this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

Lecture: Inorganic chemistry

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
- chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
- quantitative Relationships and Stoichiometric Equations
- characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
- descriptive part: selected chemical compounds and their preparation and properties

Lecture: Organic chemistry

- functional groups and compound classes
- classification of chemical reactions in organic chemistry
- organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
- chemical and microbial degradation of organic matter in the environment
- summary parameters
- organic environmental contaminants

Lecture: Biology and ecology of water, soil and air systems

The following topics are presented within the lecture:

- Introduction in history of microbiology
- Important water-based/water related diseases
- Function of microscopy of staining techniques
- Structure and function of prokaryotic cells
- Structure and function of eucaryotic cells
- Necessity and effects of microbial nutrition
- Microbial growth relations and possible limitations
- Microbial metabolism: Energy production, conservation and release
- Microbial metabolism: Enzymes syntheses and regulation.

Lecture: Technical and medical microbiology for engineers

- Important (sewage) water based/water related diseases/detection and possible countermeasures
- Important soil and air connected diseases
- (micro)biological principles in application of engineering techniques
• Implication of engineer work on ecosystems /environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

10. Zuordnung zum Curriculum in diesem Studiengang:

| Double M.D. Water Resources Engineering and Management | ← Chalmers → Incoming → Semi-Compulsory Modules |
| Double M.D. Water Resources Engineering and Management | ← Chalmers → Outgoing → Pflichtmodule |
| Double M.D. Water Resources Engineering and Management | ← Mara → Incoming → Compulsory Modules |
| Double M.D. Water Resources Engineering and Management | ← Mara → Outgoing → Pflichtmodule |
| M.Sc. Water Resources Engineering and Management | ← Vertiefungsmodul → Vertiefungsmodule Pflicht |

11. Empfohlene Voraussetzungen:

Technical Mechanics

- Introduction to the statics of rigid bodies
- Introduction to elastostatics
- Introduction to the mechanics of incompressible fluids

Higher Mathematics

- Partial differential equations
- Vector analysis
- Numerical integration

Fundamentals of Flow Mechanics

- Conservation equations for mass, momentum, energy
- Navier-Stokes, Euler, Reynolds, Bernoulli equation

12. Lernziele:

Students have fundamental knowledge of flow in various natural hydrosystems and its application in civil and environmental engineering.

13. Inhalt:

The lecture deals with flow in natural hydrosystems with particular emphasis on groundwater / seepage flow and on flow in surface water / open channels. Groundwater hydraulics includes flow in confined, semi-confined and unconfined groundwater aquifers, wells, pumping tests and other hydraulic investigation methods for exploring groundwater aquifers. In addition, questions concerning regional groundwater management (z.B. recharge, unsaturated zone, saltwater intrusion) are discussed. Using the example of groundwater flow, fundamentals of CFD (Computational Fluid Dynamics) are explained, particularly the numerical discretisation techniques finite volume and finite difference. The
hydraulics of surface water deals with shallow water equations / Saint Venant equations, unstationary channel flow, turbulence und layered systems. Calculation methods such as the methods of characteristics are explained. The contents are:

- Potential flow and groundwater flow
- Computational Fluid Dynamics
- Shallow water equations for surface water
- Characteristikenmethode
- Examples from civil and environmental engineering

    ➔ Vertiefungsmodule --> Vertiefungsmodule Pflicht
11. Empfohlene Voraussetzungen:
12. Lernziele:
    The students have detailed knowledge about waste avoidance procedures in household and industry. Waste avoidance includes the ecology-oriented daily shopping, the substitution of contaminated materials in the industrial production as well as the Zero Emission Society. In the case of unavoidable waste fractions, the students acquire the competence to establish collection and transportation systems for these wastes, within the logistic, economic and legal frame. Main emphasis is given to the collection of recyclables. The students know the relevant factors which influence the waste amount and waste composition in general and in particular within the separate collection of recyclables. The students are acquainted with the state of the art of recycling technologies for separate collected paper, glass, metal and plastic including the pretreatment process. They have knowledge of the aerobic and anaerobic treatment and utilization of separate collected biowaste. Not avoided and recycled waste has to be treated before disposing off e.g. in a landfill site. The students possess a general knowledge of the mechanical and biological treatment technology as well as of the thermal waste treatment. They are able to evaluate the different treatment and recycling processes from an ecological and economic point of view. The students have knowledge about the most important components of the urban drainage and the basic treatment processes of wastewater. Thus they are able to compare different systems in dependence of changing boundary conditions and assess the effectiveness and pros and cons of the systems, e.g. concerning impacts on the environment, economical and operational aspects. They obtain an understanding for system connections between the urban drainage system and the wastewater treatment system as well as between the urban water system and the environment.
13. Inhalt:
    Solid Waste Management:
    • Waste generation and waste composition
    • National and international regulations for waste
    • Waste avoidance
    • Collection and transport of waste
- Separate collection of recyclables
- Sorting of recyclables
- Recycling technologies for paper, glass, metal, plastic
- Biological treatment of waste
- Waste Disposal
- Ecological indicator systems

Waste Water Technology:
- Basics of urban drainage and municipal wastewater treatment
- Quantity and Composition of Wastewater
- Urban drainage systems
- stormwater treatment
- mechanical wastewater treatment
- biological wastewater treatment
- sludge treatment
- natural close and ECOSAN systems

11. Empfohlene Voraussetzungen:  
Chemistry and Biology for Environmental Engineers  
Sanitary Engineering

12. Lernziele:  
Advanced knowledge of processes and concepts for urban drainage and municipal wastewater treatment systems  
Basics of construction and dimensioning of different urban drainage systems, stormwater treatment facilities and wastewater treatment plants as a base for dimensioning and discussion of proved and innovative technologies  
Deeper understanding for system connections as base for a decisions during the planning process

13. Inhalt:  
Design of sewer systems and stormwater treatment  
(Dr.-Ing. Ulrich Dittmer)  
principles of collection and disposal  
design of combined and separate sewer systems  
Sustainable urban drainage systems (SUDS) and low impact design(LID)  
Application of rainfall runoff models (computer exercise using U.S. EPA Stormwater Management Model)  
different techniques for treatment and retention  
design of treatment facilities  
Design of wastewater treatment plants (Prof. Dr.-Ing. Heidrun Steinmetz)

Municipal wastewater treatment  
different techniques for advanced biological wastewater treatment (nitrogen and phosphorous removal)
principles of process engineering

design of biological wastewater treatment plants and the main important aggregates

design of sludge treatment plants

Seminar: feasibility studies

(Prof. Dr.- Ing. Heidrun Steinmetz and external consultants)

special examples for sanitation concepts for world wide application

Ecological sanitation and resource orientated systems

- M.Sc. Water Resources Engineering and Management ➔ Zusatzmodule

11. Empfohlene Voraussetzungen:

- Recommended background knowledge: Basic knowledge of hydrology and geohydrology  
- Prerequisite module: none

12. Lernziele:

- **Hydrological Modeling:**  
  Construction of models for each part in the runoff process and how these models are used and integrated in different environment management systems.

- **Integrated model systems for the groundwater management:**  
  Design of hydrogeological databases, visualization of data, GIS-Operations for the groundwater and hydrological modeling, Geostatistic, stochastic modeling, Monte Carlo Methods.

13. Inhalt:

- **Hydrological Modeling:**  
  What happens to the rain? This is the basic question that needs to be addressed in order to predict the amount of discharge at a certain location in a river system at a given time. Which parts of the fate of rainfall can be determined on a physical basis, and which are still left to empirical searching? Beside the qualitative determination of e.g. the processes of evapotranspiration, infiltration, interflow etc. we also need to describe the quantities of these processes to be able to forecast e.g. flood events.

  Hydrological watershed modelling is fundamental to integrated water management. There are complex interactions between the elements of the environmental continuum. In order to predict future behaviour and to quantify effects of management changes, quantitative mathematical descriptions are needed. A number of advanced hydrological watershed models have been developed in the last 30 years. A few of them will be reviewed in terms of their data needs and the predictive power. The participants are encouraged to form groups and to use their selected models for the same catchment so that the different approaches are compared.
Integrated model systems for the groundwater management:
Modern integrated model systems require techniques for the efficient construction of ground water models and their integration in “Decision Support Systems” as well as strategies for the handling of uncertainties. The course will discuss the specific “GIS-Methods” that are important for the integrations of databases, the visualization of data and the calculation of spatial data like ground water recharge. Special focus is laid on GIS supported hydrological modeling of the ground water recharge and the runoff parameters as well as adequate choice of the hydrological model concepts for the calculation of the local water balance in different data situations. To handle the model uncertainties, geostatistic methods and associated stochastic modeling attempts like the “Monte Carlo Simulation” will be mentioned.

11. Empfohlene Voraussetzungen:

12. Lernziele: The students understand the major challenges, objectives, strategies and instruments in spatial planning and urban development in Europe as well as in developing and countries in transition. The students are acquainted with the legal framework of comprehensive and sector planning and know the capabilities and limits of public planning as “positive” and “negative” planning.

13. Inhalt: The course Regional Planning I covers the following topics:
- International Planning studies
- Overview on current planning issues
- Basic Terms of Spatial Planning
- Strategies in Spatial Planning
- Instruments of Spatial Planning
- Performance of Plans, Assessing Plans

The course Urban Planning I provides an overview on the origin of planned urban development, starting in Greece and the Roman Empire, passing through all important periods up to the 21st century. The second part introduces urbanisation processes in third world countries, planned and unplanned urban conglomerations, including Mega Cities and Global Cities.

    prerequisite modules: Regional and Urban Planning I

12. Lernziele:
    The students are acquainted with basic methods of analysis and assessment in spatial planning. The students are able to cope with function, prerequisites and methodical problems of the methods presented. The lectures demonstrate the usage of planning instruments and methods based on planning cases from Germany and other countries.

13. Inhalt:
    The course Regional Planning II deals with the following planning methods:
    • Indicator-based monitoring and evaluation methods
    • Multi-criteria decision analysis (e.g. cost-benefit analysis, utility value analysis, analytic hierarchy process)
    • Methods of impact assessment
    • Techniques of demand forecast and land suitability analysis
    • Hazard and vulnerability analysis (climate change adaptation)

    The course Urban Planning II gives an overview on:
    • Levels of spatial planning in urban areas
    • Urban development planning
    • Urban analysis
    • Urban renewal
    • Urban planning instruments
    • Land use planning and implementation planning
    • Legal framework

11. Empfohlene Voraussetzungen: None

12. Lernziele: Power Demand, Supply and Distribution:
The students…

• know the German, European and worldwide energy markets related to demand, supply and its distribution capabilities
• are aware of that non-renewable energy sources are strictly limited and time-scales for conversion of energy markets long
• have an idea about the relations between energy, politics, social changes and influences on environment
• have a basic knowledge about present energy conversion systems, theoretical limits of efficiencies, and the potential to enhance applied technology
• have a basic understanding about where and how energy is provided and distributed
• comprehend the balance between load and supply in electrical grids and the resulting necessity for control energy.

Water Demand, Supply and Distribution:
The students…

• know the German and worldwide water systems related to demand, supply and its distribution capabilities
• have an overview on the water supply situation all over the world.
• recognize the different possibilities and levels of water supply
• have an idea of the relations between water, politics, social changes and influences on environment.

13. Inhalt: Power Demand, Supply and Distribution:
- Energy demand, energy supply
- Energy generation
  - overview of different types of power plants
  - renewable energy
  - thermal power plants (conventional and nuclear)
- Areas of application of different power plants
- Emission control techniques
- Cooling of thermal power plants
  - methods
  - water resources aspects
- Energy transport and energy storage
- Net techniques
- Energy market
  - trade
  - politics
  - law
- social changes due to energy supply

Water Demand, Supply and Distribution:

- Water supply and water distribution: necessity, basic requirements, elements, hydrological cycle
- Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods
- Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas
- Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems.
- Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters
- Water storage: necessity, types and functions of tanks and reservoirs
- Case study: planning and design of a water supply system for a small town

Lecture notes can be downloaded from the internet. Hints are given for additional literature from the internet as well as libraries.

11. Empfohlene Voraussetzungen:

12. Lernziele:

**Lecture: Inorganic chemistry**

The students

- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

**Lecture: Organic chemistry**

The students

- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the common rules for their nomenclature
- know the most important representatives thereof and are able to draw their structural formulae
- know the structure and properties of important bio-molecules such as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic acids
- know the most important reactions involved in chemical and microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general function with respect to cell structures, enzymatic and immune reactions
- knows selected environmental organic contaminants (PAH, dioxins, pesticides etc.) and their properties

Lecture: Biology and ecology of water, soil and air systems

The students
- know about the relation between water, soil and air compartments and many diseases, happening especially in developing countries
- know about the reasons for break out of diseases, the structure and function of prokaryotic and eucaryotic cells as well as the methods for identification and determination of growth conditions and possible growth limitations
- comprehend microbial metabolism, energy production, release and conservation, enzyme syntheses and their regulation.
- know important events and scientists in the history of biology
- know basics in ecology of natural and artificial ('technical') ecosystems as well as selected methods to detect distorted equilibria in technical ecosystems influenced by mankind

Lecture: Technical and medical microbiology for engineers

The students
- know the most important microorganisms being active in plants treating waste water, air and contaminated soil
- know the kind of participation in purification and thus the procedures used to make them feel happy as well as the problems associated with excess biomass
- are aware of a detailed overview of the kind of medically important microorganisms and of the most relevant agents of illness met in these
plants; this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

**Lecture: Inorganic chemistry**

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
- chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
- quantitative Relationships and Stoichiometric Equations
- characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
- descriptive part: selected chemical compounds and their preparation and properties

**Lecture: Organic chemistry**

- functional groups and compound classes
- classification of chemical reactions in organic chemistry
- organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
- chemical and microbial degradation of organic matter in the environment
- summary parameters
- organic environmental contaminants

**Lecture: Biology and ecology of water, soil and air systems**

The following topics are presented within the lecture:

- Introduction in history of microbiology
- Important water based/water related diseases
- Function of microscopy of staining techniques
- Structure and function of prokaryotic cells
- Structure and function of eucaytotic cells
- Necessity and effects of microbial nutrition
- Microbial growth relations and possible limitations
- Microbial metabolism: Energy production, conservation and release
- Microbial metabolism: Enzymes syntheses and regulation.

**Lecture: Technical and medical microbiology for engineers**

- Important (sewage) water based/water related diseases/detection and possible countermeasures
- Important soil and air connected diseases
- (micro)biological principles in application of engineering techniques
• Implication of engineer work on ecosystems/environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

11. Empfohlene Voraussetzungen:
   Technical Mechanics
   • Introduction to the statics of rigid bodies
   • Introduction to elastostatics
   • Introduction to the mechanics of incompressible fluids
   Higher Mathematics
   • Partial differential equations
   • Vector analysis
   • Numerical integration
   Fundamentals of Flow Mechanics
   • Conservation equations for mass, momentum, energy
   • Navier-Stokes, Euler, Reynolds, Bernoulli equation

12. Lernziele:
   Students have fundamental knowledge of flow in various natural hydrosystems and its application in civil and environmental engineering.

13. Inhalt:
   The lecture deals with flow in natural hydrosystems with particular emphasis on groundwater / seepage flow and on flow in surface water / open channels. Groundwater hydraulics includes flow in confined, semi-confined and unconfined groundwater aquifers, wells, pumping tests and other hydraulic investigation methods for exploring groundwater aquifers. In addition, questions concerning regional groundwater management (z.B. recharge, unsaturated zone, saltwater intrusion) are discussed. Using the example of groundwater flow, fundamentals of CFD (Computational Fluid Dynamics) are explained, particularly the numerical discretisation techniques finite volume und finite difference. The
hydraulics of surface water deals with shallow water equations / Saint Venant equations, unstationary channel flow, turbulence und layered systems. Calculation methods such as the methods of characteisitics are explained. The contents are:

- Potential flow and groundwater flow
- Computational Fluid Dynamics
- Shallow water equations for surface water
- Charakteristikenmethode
- Examples from civil and environmental engineering

11. Empfohlene Voraussetzungen:

12. Lernziele:

   Advanced Studies in Hydraulic Structures: The students...
   - Know about the basic features of hydraulic structures
   - have an overview what are the main components and know how to arrange them in order to ensure a satisfying operation
   - are able to dimension all parts of different hydraulic structures
   - are aware of implicating river works into an overall context of a fluvial system and know how to act and to evaluate in spatial and temporal interrelation
   - are able to realize the economic and ecologic significance of hydraulic structures as dams, reservoirs and hydro power plants

   Case Study in Hydraulic Structures: The students...
   - are able to use of the gained theoretical knowledge with the help of a practical example
   - are aware of the technical relations and their effects on non-technical areas of interest
   - can give a well-founded argumentation of chosen estimations and are able to present their own results
   - can give a convincing presentation
   - are able to assess objectively different planning alternatives

13. Inhalt:

   Advanced Studies in Hydraulic Structures: The course deals with main structural components of hydraulic engineering schemes such as weirs, dams, hydro power plants, pipelines and ancillary works. The main features as hydraulic and structural dimensioning are treated. The application of structural power plants, reservoirs and river development works is discussed. Conventional engineering methods as well as approaches with improved environmental compatibility are taken into consideration.

   Case Study in Hydraulic Structures: The case study uses the content of the lecture „Advanced Studies in Hydraulic Structures“. In working
groups of 3 to five students a real hydraulic structures will be planned and completely dimensioned. There are hydraulic calculations to be carried out as hydraulic capacity of spillway, dimensioning of stilling basin, hydrological and sedimentological calculations. As well the stabilities of the structures itself has to be checked. Additionally an analysis of the demand of potentially provided electricity, drinking water or irrigation water, resp. is required. The intermediate results will be presented by the groups. Every student has to deliver at least one presentation. Finally a poster for the final presentation and assessment has to be designed. This is the basis for the development of the assessment criteria for the different alternatives.

14. Literatur:  
Lecture notes can be downloaded from the internet. Additional detailed information for the case study will be provided during the lectures.

      ➔ Spezialisierungsmodule
    - M.Sc. Water Resources Engineering and Management
      ➔ Zusatzmodule

11. Empfohlene Voraussetzungen:

12. Lernziele:
    Students have:
    • a basic understanding for the problems and requirements of industrial waste water treatment
    • an overview of measures for production integrated environmental protection, relevant treatment methods for process water and its characterization
    • an overview of water analysis including sampling, the main principles of different analytical techniques and the ways to assure the quality of chemical analysis

13. Inhalt:
    Fundamentals of industrial waste water treatment Determination of current situation possible process integrated measures measures for reuse and recirculation of water mass and concentration balance Basic elements and examples for applications to the advanced purification processes: biological waste water treatment Sampling and analytical techniques using: onsite measurements oxidation - reduction acids and bases sum parameters photometry spectrometry chromatography Analytical quality assurance

14. Literatur:

15. Lehrveranstaltungen und -formen:
    • 193301 Lecture Treatment of Industrial Waste Water
    • 193302 Lecture Water Analysis and Analytical Quality Control
16. Abschätzung Arbeitsaufwand: Time of attendance:

I Treatment of Industrial Waste Water: 2 SWS = 24 hours
II Water Analysis and Analytical Quality Control: 2 SWS = 24 hours
Exam: 2 hours

sum of attendance: 50 hours
self-study: 130 hours

**total: 180 hours**

| 19. Medienform: | power-point-presentation, blackboard and over-head projector |

20. Angeboten von: Siedlungswasserwirtschaft und Wasserrecycling
**Modul: 36450 Special Aspects of Urban Water Management**

2. Modulkürzel: 02120006  
5. Moduldauer: 1 Semester

3. Leistungspunkte: 6.0 LP  

4. SWS: 4.0  
7. Sprache: Englisch

8. Modulverantwortlicher: Ralf Minke

9. Dozenten:  
   • Ralf Minke  
   • Ulrich Dittmer  
   • Klaus Werner König

10. Zuordnung zum Curriculum in diesem Studiengang:  
    DoubleM.D. Water Resources Engineering and Management → Chalmers -->Incoming -->Semi-Compulsory Modules  
    → M.Sc. Water Resources Engineering and Management  
    → Spezialisierungsmodule  
    → M.Sc. Water Resources Engineering and Management  
    → Zusatzmodule

11. Empfohlene Voraussetzungen:  
    Inhaltlich:  
    Grundlegende Kenntnisse der Gesamt-zusammenhänge der Siedlungswasser- und Wasserwirtschaft.  
    Vertiefte Kenntnisse der Abwassertechnik, der Wassergütewirtschaft, der Wasserversorgung oder des allgemeinen Managements von Wasserressourcen.  
    Formal:  
    Wasserversorgungstechnik I oder  
    Abwassertechnik I oder  
    Waste Water Technology oder Water Quality and Treatment

12. Lernziele:  
    Fachlich:  
    Die Studierenden entwickeln ein Verständnis für Zusammenhänge über ihre Teildisziplin hinaus. Sie können bei Entscheidungen und Planungen zwischen konkurrierenden Belangen der Siedlungswasserwirtschaft, Wasserversorgung und anderer Infrastrukturbereiche fachlich fundiert abwägen.  
    Methodisch:  
    Die Studierenden können selbständig mit internationaler wissenschaftlicher Literatur zu ihrem jeweiligen Fachgebiet umgehen, Ergebnisse kritisch bewerten und so ein eigenes Bild des Standes der Wissenschaft erarbeiten und präsentieren.

13. Inhalt:  
    - Wechselwirkungen zwischen Teilbereichen der Siedlungswasserwirtschaft am Beispiel des Umgangs mit Regenwasser  
    - Jährlich wechselnde Spezialthemen entsprechend dem wissenschaftlichen und technischen Fortschritt

- Daniel Dobslaw

10. Zuordnung zum Curriculum in diesem Studiengang:
- DoubleM.D. Water Resources Engineering and Management
  - Chalmers -->Incoming -->Semi-Compulsory Modules
  - Chalmers -->Outgoing -->Pflichtmodule
  - Mara -->Incoming -->Elective Modules
  - Mara -->Outgoing -->Pflichtmodule
- M.Sc. Water Resources Engineering and Management
  - Spezialisierungsmodul
  - Vertiefungsmodul -->Vertiefungsmodul Wahlpflicht
  - Zusatzmodule

11. Empfohlene Voraussetzungen:

12. Lernziele:

**Lecture: Inorganic chemistry**

The students
- know the fundamental concepts of chemistry (atomic structure, periodic system, chemical formulae, stoichiometry, molecular structures) and are able to use them,
- know the principle types of chemical substances and chemical reactions and can apply their knowledge to synthetic problems,
- know about the most important industrial compounds, their preparation and environmental aspects in their application.

**Lecture: Organic chemistry**

The students
- can identify important functional groups in organic molecules
- know the main compound classes in organic chemistry and the
  common rules for their nomenclature
- know the most important representatives thereof and
  are able to draw their structural formulae
- know the structure and properties of important bio-molecules such
  as fats, carbohydrates, proteins, nucleic acids, ATP, lignin and humic
  acids
- know the most important reactions involved in chemical and
  microbial degradation of organic matter
- know summary parameters used to characterize water quality
- know the properties of bio-molecules and can explain their general
  function with respect to cell structures, enzymatic and immune reactions
- knows selected environmental organic contaminants (PAH, dioxins,
  pesticides etc.) and their properties

**Lecture: Biology and ecology of water, soil and air systems**

The students
- know about the relation between water, soil and air compartments
  and many diseases, happening especially in developing countries
- know about the reasons for break out of diseases, the structure and
  function of prokaryotic and eucaryotic cells as well as the methods for
  identification and determination of growth conditions and possible growth
  limitations
- comprehend microbial metabolism, energy production, release and
  conservation, enzyme syntheses and their regulation.
- know important events and scientists in the history of biology
- know basics in ecology of natural and artificial ('technical')
  ecosystems as well as selected methods to detect distorted equilibria in
  technical ecosystems influenced by mankind

**Lecture: Technical and medical microbiology for engineers**

The students
- know the most important microorganisms being active in plants
  treating waste water, air and contaminated soil
- know the kind of participation in purification and thus the procedures
  used to make them feel happy as well as the problems associated with
  excess biomass
- are aware of a detailed overview of the kind of medically important
  microorganisms and of the most relevant agents of illness met in these
plants; this holds also for the compartments 'drinking water' and 'sewage sludge'.

13. Inhalt:

Lecture: Inorganic chemistry

- atomic structure: stable nuclear particles, atomic nuclei, isotopes and radioactivity, atomic spectra and the hydrogen atom, heavier atoms
- the periodic system of the elements: the sequence of elements, the electronic configuration of some elements, the periodicity of some properties
- chemical bonding: the ionic bond, the metallic bond, the covalent bond, hydrogen bonding, van der Waals forces
- quantitative Relationships and Stoichiometric Equations
- characterizing chemical reactions: the chemical equilibrium, water: the solvent, acid/base reactions, redox reactions
- descriptive part: selected chemical compounds and their preparation and properties

Lecture: Organic chemistry

- functional groups and compound classes
- classification of chemical reactions in organic chemistry
- organic bio-molecules (e.g. proteins, carbohydrates, nucleic acids, fats, humic acids, lignin): structure and function
- chemical and microbial degradation of organic matter in the environment
- summary parameters
- organic environmental contaminants

Lecture: Biology and ecology of water, soil and air systems

The following topics are presented within the lecture:

- Introduction in history of microbiology
- Important waterbased/water related diseases
- Function of microscopy of staining techniques
- Structure and function of prokaryotic cells
- Structure and function of eucaryotic cells
- Necessity and effects of microbial nutrition
- Microbial growth relations and possible limitations
- Microbial metabolism: Energy production, conservation and release
- Microbial metabolism: Enzymes syntheses and regulation.

Lecture: Technical and medical microbiology for engineers

- Important (sewage) water based /water related diseases/detection and possible countermeasures
- Important soil and air connected diseases
- (micro)biological principles in application of engineering techniques
• Implication of engineer work on ecosystems/environment protection problems

Some test systems for estimation of (bio)degradability of chemicals will be evaluated

11. Empfohlene Voraussetzungen:
    Technical Mechanics
    • Introduction to the statics of rigid bodies
    • Introduction to elastostatics
    • Introduction to the mechanics of incompressible fluids
    Higher Mathematics
    • Partial differential equations
    • Vector analysis
    • Numerical integration
    Fundamentals of Flow Mechanics
    • Conservation equations for mass, momentum, energy
    • Navier-Stokes, Euler, Reynolds, Bernoulli equation
12. Lernziele:
    Students have fundamental knowledge of flow in various natural hydrosystems and its application in civil and environmental engineering.
13. Inhalt:
    The lecture deals with flow in natural hydrosystems with particular emphasis on groundwater / seepage flow and on flow in surface water / open channels. Groundwater hydraulics includes flow in confined, semi-confined and unconfined groundwater aquifers, wells, pumping tests and other hydraulic investigation methods for exploring groundwater aquifers. In addition, questions concerning regional groundwater management (z.B. recharge, unsaturated zone, saltwater intrusion) are discussed. Using the example of groundwater flow, fundamentals of CFD (Computational Fluid Dynamics) are explained, particularly the numerical discretisation techniques finite volume and finite difference. The
The hydraulics of surface water deals with shallow water equations (Saint Venant equations), unstationary channel flow, turbulence, and layered systems. Calculation methods such as the methods of characteristics are explained. The contents are:

- Potential flow and groundwater flow
- Computational Fluid Dynamics
- Shallow water equations for surface water
- Characteristics method
- Examples from civil and environmental engineering

11. Empfohlene Voraussetzungen:

12. Lernziele: The students have detailed knowledge about waste avoidance procedures in household and industry. Waste avoidance includes the ecology-oriented daily shopping, the substitution of contaminated materials in the industrial production as well as the Zero Emission Society. In the case of unavoidable waste fractions, the students acquire the competence to establish collection and transportation systems for these wastes, within the logistic, economic and legal frame. Main emphasis is given to the collection of recyclables. The students know the relevant factors which influence the waste amount and waste composition in general and in particular within the separate collection of recyclables. The students are acquainted with the state of the art of recycling technologies for separate collected paper, glass, metal and plastic including the pretreatment process. They have knowledge of the aerobic and anaerobic treatment and utilization of separate collected biowaste. Not avoided and recycled waste has to be treated before disposing off e.g. in a landfill site. The students possess a general knowledge of the mechanical and biological treatment technology as well as of the thermal waste treatment. They are able to evaluate the different treatment and recycling processes from an ecological and economic point of view. The students have knowledge about the most important components of the urban drainage and the basic treatment processes of wastewater. Thus they are able to compare different systems in dependence of changing boundary conditions and assess the effectiveness and pros and cons of the systems, e.g. concerning impacts on the environment, economical and operational aspects. They obtain an understanding for system connections between the urban drainage system and the wastewater treatment system as well as between the urban water system and the environment.

13. Inhalt: Solid Waste Management:
    • Waste generation and waste composition
    • National and international regulations for waste
    • Waste avoidance
    • Collection and transport of waste
• Separate collection of recyclables
• Sorting of recyclables
• Recycling technologies for paper, glass, metal, plastic
• Biological treatment of waste
• Waste Disposal
• Ecological indicator systems

Waste Water Technology:
• Basics of urban drainage and municipal wastewater treatment
• Quantity and Composition of Wastewater
• Urban drainage systems
• stormwater treatment
• mechanical wastewater treatment
• biological wastewater treatment
• sludge treatment
• natural close and ECOSAN systems

    ➔ M.Sc. Water Resources Engineering and Management
    ➔ Zusatzmodule

11. Empfohlene Voraussetzungen:
    Chemistry and Biology for Environmental Engineers
    Sanitary Engineering

12. Lernziele:
    Advanced knowledge of processes and concepts for urban drainage and municipal wastewater treatment systems
    Basics of construction and dimensioning of different urban drainage systems, stormwater treatment facilities and wastewater treatment plants as a base for dimensioning and discussion of proved and innovative technologies
    Deeper understanding for system connections as base for a decisions during the planning process

13. Inhalt:
    Design of sewer systems and stormwater treatment
    (Dr.-Ing. Ulrich Dittmer)
    principles of collection and disposal
    design of combined and separate sewer systems
    Sustainable urban drainage systems (SUDS) and low impact design (LID)
    Application of rainfall runoff models (computer exercise using U.S. EPA Stormwater Management Model)
    different techniques for treatment and retention
    design of treatment facilities
    Design of wastewater treatment plants (Prof. Dr.-Ing. Heidrun Steinmetz)
    Municipal wastewater treatment
    different techniques for advanced biological wastewater treatment (nitrogen and phosphorous removal)
principles of process engineering

design of biological wastewater treatment plants and the main important aggregates

design of sludge treatment plants

Seminar: feasibility studies

(Prof. Dr.-Ing. Heidrun Steinmetz and external consultants)

special examples for sanitation concepts for world wide application

Ecological sanitation and resource orientated systems
case studies

   ➞ Chalmers -->Outgoing -->Wahlmodule
   ➞ M.Sc. Water Resources Engineering and Management → Spezialisierungsmodul
   ➞ M.Sc. Water Resources Engineering and Management → Zusatzmodule

11. Empfohlene Voraussetzungen:

   Recommended background knowledge:
   Geoengineering:
   Basic knowledge of mechanics and groundwater flow
   Geohydrology: Basic knowledge of groundwater hydraulics
   Prerequisite module: none

12. Lernziele:

   **Geoengineering:**
   The students have the required skills to treat fundamental soil mechanics problems such as: groundwater flow, consolidation, slope stability, settlement and soil strength calculations.

   **Geohydrology:**
   The students have a strong foundation in the applied skills required to locate, analyse, assess, develop, and protect groundwater resources.

13. Inhalt:

   **Geoengineering:**
   This course includes information about the origin of soils and soil classification methods. It also includes the basics of groundwater flow as used in soil mechanics. Common geotechnical problems such as slope stability and soil consolidation are discussed and clarified. The stresses in soil, stiffness of soils and strength of soils are explained in details.

   **Geohydrology:**
   Covers the most important concepts of geology and hydrogeology; the interpretation of hydrogeological information from maps, aerial photographs, geophysical measurements and field data; the principles of groundwater development and the understanding of hydrogeological systems through case studies. A brief overview is given on the analysis of hydrochemical data and isotopes.

14. Literatur:

10. Zuordnung zum Curriculum in diesem Studiengang:
- DoubleM.D. Water Resources Engineering and Management ➔ Chalmers -->Incoming -->Semi-Compulsory Modules
- DoubleM.D. Water Resources Engineering and Management ➔ Chalmers -->Outgoing -->Wahlmodule
- M.Sc. Water Resources Engineering and Management ➔ Vertiefungsmodule -->Vertiefungsmodule Pflicht

11. Empfohlene Voraussetzungen:

12. Lernziele:
- Advanced Studies in Hydraulic Structures: The students...
  - Know about the basic features of hydraulic structures
  - have an overview what are the main components and know how to arrange them in order to ensure a satisfying operation
  - are able to dimension all parts of different hydraulic structures
  - are aware of implicating river works into an overall context of a fluvial system and know how to act and to evaluate in spatial and temporal interrelation
  - are able to realize the economic and ecologic significance of hydraulic structures as dams, reservoirs and hydro power plants
- Case Study in Hydraulic Structures: The students...
  - are able to use of the gained theoretical knowledge with the help of a practical example
  - are aware of the technical relations and their effects on non-technical areas of interest
  - can give a well-founded argumentation of chosen estimations and are able to present their own results
  - can give a convincing presentation
  - are able to assess objectively different planning alternatives

13. Inhalt:
- Advanced Studies in Hydraulic Structures: The course deals with main structural components of hydraulic engineering schemes such as weirs, dams, hydro power plants, pipelines and ancillary works. The main features as hydraulic and structural dimensioning are treated. The application of structural power plants, reservoirs and river development works is discussed. Conventional engineering methods as well as approaches with improved environmental compatibility are taken into consideration.
- Case Study in Hydraulic Structures: The case study uses the content of the lecture „Advanced Studies in Hydraulic Structures“. In working
groups of 3 to five students a real hydraulic structures will be planned and completely dimensioned. There are hydraulic calculations to be carried out as hydraulic capacity of spillway, dimensioning of stilling basin, hydrological and sedimentological calculations. As well the stabilities of the structures itself has to be checked. Additionally an analysis of the demand of potentially provided electricity, drinking water or irrigation water, resp. is required. The intermediate results will be presented by the groups. Every student has to deliver at least one presentation. Finally a poster for the final presentation and assessment has to be designed. This is the basis for the development of the assessment criteria for the different alternatives.

14. Literatur: Lecture notes can be downloaded from the internet. Additional detailed information for the case study will be provided during the lectures.

11. Empfohlene Voraussetzungen: Recommended background knowledge:
    Hydrology, Hydrogeology, Fluid Mechanics

12. Lernziele:
    **Field Course Hydrogeology:**
    The students know the most common field investigations used in groundwater. This includes the relevant theoretical basics on groundwater hydraulics, hydrogeology and field methods. When applying theoretical knowledge on practical problems, the participants are able to recognise critical points and develop appropriate solutions.

    **Pumping Test Analysis**
    The participants know the basic theories to analyse pumping tests and are able to use computer based methods like Spreadsheet Calculations for Analysis like Theis, Cooper-Jacob, Diagnostic Plots, Inverse Normalized Diagnostics, Recognition of Inner / Outer Boundaries, Heterogeneity, Well Effects and Handling of noise and trends.

13. Inhalt:
    **Field Course Hydrogeology:**
    In the field:
    • Soil Sampling / Drilling
    • Surveying / Levelling
    • Piezometric Heads / Potentiometric Surfaces
    • Pumping Test - Recovery Test
    • Piezometer test / Slug test
    • Tracer Test
    • Geophysical Borehole measurements / Natural groundwater velocity
    • Groundwater Chemistry
    • Hydrogeological Site Assessment

    In the lab:
    • Column Experiments to Determine the Hydrodynamic Dispersion Coefficient and the Hydraulic Conductivity
    • Particle-Size Distribution and Soil Characterisation
    • Rocks: Definitions, Characterisation, Classification, Genesis, Hydraulic Properties

    In the classroom:
• Theoretical background of the methods applied in the field and in the laboratory (see above)

**Pumping Test Analysis**

Basic theory and computer exercises to evaluate and analyse the pumping tests.
Analytical techniques, Diagnostic Plots, stationary / transient conditions, interior / outer boundary conditions, step-drawdown tests and Well Performance Tests, spatial distribution of parameters, regional parameters, effective parameters

11. Empfohlene Voraussetzungen: none (BAU), advisable LWW_Wabau  none (UMW), advisable LWW_Gew  Hydraulic Structures (WAREM)

12. Lernziele:

**River Engineering and Sediment Management**

The students...

- are aware of rivers must be regarded and managed based on an integrated approach
- know the basic concept of the European Water Framework Directive (WFD) and the German legal framework for river basin management
- are able to analyze and estimate the consequences of the WFD based inventory for future management
- are aware of sediment transport processes and of the complexity of the interactions and relations
- recognize the possibilities and limitations of sediment management strategies

**Integrated Flood Protection Measures**

The students...

- are aware of the fact that flood protection is an integral process, based on different components (e.g. technical flood protection measures, prevention)
- know the basic physical processes: dynamics of flood events, calculation of discharges and water depths, flood wave propagation; functionality of retention and protection structures: reservoirs, dams and dikes
- know 1-D and 2-D numerical hydro-dynamic models
- are able to apply their knowledge on practical engineering problems related to flood protection

13. Inhalt:

The module consists of two lectures:

**River Engineering and Sediment Management**

- Basic approaches of river basin management (legal framework)
• Systematics and results of basic inventory due to the WFD
• Anthropogenic impacts on river basins
• Origin of sediments and fundamental principles of transport
• Sediment management measures on different scales

**Integrated Flood Protection Measures**

• Socio-economic aspects of flood damage
• Calculation of water depths
• Hydro-dynamic flood wave calculation, Saint Venant-equation
• Technical flood protection measures
• Design and operation of retention basins
• Set-up of damage and risk maps, design of overtopping earthen dams and dikes
• Probability of failure, reliability calculation, flood risk management

14. **Literatur:**
Lecture notes and exercise material can be downloaded from the internet. Hints are given for additional literature from the internet as well as libraries.

| 11. Empfohlene Voraussetzungen: | Recommended background knowledge: Basic knowledge of hydrology and geohydrology  
Prerequisite module: none |
| 12. Lernziele: | **Hydrological Modeling:** Construction of models for each part in the runoff process and how these models are used and integrated in different environment management systems.  
**Integrated model systems for the groundwater management:** Design of hydrogeological databases, visualization of data, GIS-Operations for the groundwater and hydrological modeling, Geostatistic, stochastic modeling, Monte Carlo Methods. |
| 13. Inhalt: | **Hydrological Modeling:** What happens to the rain? This is the basic question that needs to be addressed in order to predict the amount of discharge at a certain location in a river system at a given time. Which parts of the fate of rainfall can be determined on a physical basis, and which are still left to empirical searching? Beside the qualitative determination of e.g. the processes of evapotranspiration, infiltration, interflow etc. we also need to describe the quantities of these processes to be able to forecast e.g. flood events. Hydrological watershed modelling is fundamental to integrated water management. There are complex interactions between the elements of the environmental continuum. In order to predict future behaviour and to quantify effects of management changes, quantitative mathematical descriptions are needed. A number of advanced hydrological watershed models have been developed in the last 30 years. A few of them will be reviewed in terms of their data needs and there predictive power. The participants are encouraged to form groups and to use their selected models for the same catchment so that the different approaches are compared. |
Integrated model systems for the groundwater management:
Modern integrated model systems require techniques for the efficient construction of ground water models and their integration in “Decision Support Systems” as well as strategies for the handling of uncertainties. The course will discuss the specific “GIS-Methods” that are important for the integrations of databases, the visualization of data and the calculation of spatial data like ground water recharge. Special focus is laid on GIS supported hydrological modeling of the ground water recharge and the runoff parameters as well as adequate choice of the hydrological model concepts for the calculation of the local water balance in different data situations. To handle the model uncertainties, geostatistic methods and associated stochastic modeling attempts like the “Monte Carlo Simulation” will be mentioned.

• Nicolas Schwenck |
→ M.Sc. Water Resources Engineering and Management → Spezialisierungsmodul  
→ M.Sc. Water Resources Engineering and Management → Vertiefungsmodul -->Vertiefungsmodul Wahlpflicht  
→ M.Sc. Water Resources Engineering and Management → Zusatzmodul |
| 11. Empfohlene Voraussetzungen: | Recommended background knowledge:  
Higher Mathematics:  
• Partial differential equations  
• Numerical integration  
Fundamentals of fluid mechanics:  
• Conservation equations for mass, momentum, energy  
• Mathematical descr |
| 12. Lernziele: | Students can select suitable numerical methods for solving problems from fluid mechanics and have basic knowledge of implementing a numerical model in C. |
| 13. Inhalt: | Discretisation methods:  
• Knowledge of the common methods (finite differences, finite elements, finite volume) and the differences between them  
• Advantages and disadvantages and of the methods and thus of their applicability  
• Derivation of the various methods  
• Use and choice of the correct boundary conditions for the various methods  
Time discretisation:  
• Knowledge of the various possibilities  
• Assessment of stability, computational effort, precision  
• Courant number, CFL criterion  
Transport equation:  
• Various discretisation possibilities  
• Physical background |
• Stability criteria of the methods (Peclet number)

Clarification of concepts: model, simulation

Application of the finite element method to the stationary groundwater equation Setting-up of a simulation programme for modeling groundwater:

• Programme requirements
• Programming individual routines

Fundamentals of programming in C:

• Control structures
• Functions
• Arrays
• Debugging

Visualisation of the simulation results

15. Lehrveranstaltungen und -formen:
• 501401 Lecture and Exercise Modeling of Hydrosystems 1, Fundamentals
• 501403 Lecture and Exercise Modeling of Hydrosystems 2, Applications

16. Abschätzung Arbeitsaufwand:
Sum: 180h

17. Prüfungsnummer/n und -name:
50141 Modeling of Hydrosystems (PL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0

18. Grundlage für ... :

19. Medienform:
Fundamentals will be developed using the blackboard and presentation tools. Group exercises help in understanding the obtained theoretical basis.

20. Angeboten von:
Institut für Wasser- und Umweltsystemmodellierung
Modul: 50650 Planning and Design of Water Supply Facilities

2. Modulkürzel: 021210052
5. Moduldauer: 1 Semester

3. Leistungspunkte: 6.0 LP
6. Turnus: jedes 2. Semester, SoSe

4. SWS: 4.0
7. Sprache: Englisch

8. Modulverantwortlicher: Ralf Minke

9. Dozenten: Ralf Minke

12. Lernziele: The students...

• Are able to plan and design centralised water supply systems as a part of rural and urban infrastructure.
• Are able to calculate dimensions of all elements of centralised water supply systems.
• Are able to calculate costs of all elements of centralised water supply systems.
• have an idea of the relations between water, politics, social changes and influences on environment and on planning process.
• Are able to design in detail all elements of centralised water supply systems.

13. Inhalt:

• Planning process as function of topografical, economical, social, environmental boundaries.
• Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods.
• Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas, details of planning and design.
• Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems, details of planning and design.
• Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters, details of planning and design.
• Water storage: necessity, types and functions of tanks, water towers and reservoirs, details of planning and design.
• Cost calculation: Cost functions for different facilities, Calculation process, calculation of water tariff.

11. Empfohlene Voraussetzungen:
The students understand the major challenges, objectives, strategies and instruments in spatial planning and urban development in Europe as well as in developing and countries in transition. The students are acquainted with the legal framework of comprehensive and sector planning and know the capabilities and limits of public planning as “positive” and “negative” planning.

12. Lernziele:
The course Regional Planning I covers the following topics:
• International Planning studies
• Overview on current planning issues
• Basic Terms of Spatial Planning
• Strategies in Spatial Planning
• Instruments of Spatial Planning
• Performance of Plans, Assessing Plans

The course Urban Planning I provides an overview on the origin of planned urban development, starting in Greece and the Roman Empire, passing through all important periods up to the 21st century. The second part introduces urbanisation processes in third world countries, planned and unplanned urban conglomerations, including Mega Cities and Global Cities.

14. Literatur:

11. Empfohlene Voraussetzungen: prerequisite modules: Regional and Urban Planning I

12. Lernziele: The students are acquainted with basic methods of analysis and assessment in spatial planning. The students are able to cope with function, prerequisites and methodical problems of the methods presented. The lectures demonstrate the usage of planning instruments and methods based on planning cases from Germany and other countries.

13. Inhalt: The course Regional Planning II deals with the following planning methods:

   • Indicator-based monitoring and evaluation methods
   • Multi-criteria decision analysis (e.g. cost-benefit analysis, utility value analysis, analytic hierarchy process)
   • Methods of impact assessment
   • Techniques of demand forecast and land suitability analysis
   • Hazard and vulnerability analysis (climate change adaptation)

The course Urban Planning II gives an overview on:

   • Levels of spatial planning in urban areas
   • Urban development planning
   • Urban analysis
   • Urban renewal
   • Urban planning instruments
   • Land use planning and implementation planning
   • Legal framework

10. Zuordnung zum Curriculum in diesem Studiengang:
- DoubleM.D. Water Resources Engineering and Management → Chalmers -->Outgoing -->Wahlmodule
- M.Sc. Water Resources Engineering and Management → Spezialisierungsmodul
- M.Sc. Water Resources Engineering and Management → Vertiefungsmodul -- >Vertiefungsmodul Wahlpflicht
- M.Sc. Water Resources Engineering and Management → Zusatzmodule

11. Empfohlene Voraussetzungen: Recommended background knowledge: Basic knowledge of statistics
Prerequisite module: none

12. Lernziele:
**Concepts of Geostatistics:**
Knowledge of the basic geostatistical concepts, difference between Kriging and simulation, advantages and disadvantages of the discussed methods, application of Kriging and simulation

**Stochastical Modeling:**
The participants have skills in basic statistical methods used in hydrology, like time series analysis, extreme value statistics, parameter estimation methods and statistical tests.

13. Inhalt:
**Concepts of Geostatistics:**
Geostatistical procedures for the interpolation of measured values, assessment of model parameters and planning of Measuring networks are dealt with.

Contents:
- Introduction
- Statistical hypotheses: Basic concepts; Regionalized variables; Second order stationarity; Intrinsic hypothesis; Comparison of the two hypotheses; Selection of the regionalized variable
- The variogram; The experimental variogram; The theoretical variogram; Variogram models; Variogram fitting; Isotropy — anisotropy
- Ordinary Kriging: Point kriging; Block kriging; Properties of ordinary kr.; Kr. as an interpolator; Kr. and the variogram; Practice of kr.; Selection of the neighbourhood; Kr. with a “false” variogram; Cross validation; Kr. with uncertain data; Simple Kr.
- Non stationary methods: Universal kr.; Intrinsic random functions of order k; External-Drift-Kr.
- Indicator Kriging: Indicator Kriging; Applications
- Kriging with arbitrary additional information: Markov-Bayes-Kriging; Simple Updating (SU)
- Time dependent variables
- Simulations: Basic definitions; Monte Carlo; Turning Band; Unconditional simulation; Conditional simulation; Sequential
Simulation; Simulation using Markov Chains; The Hastings Algorithm; Simulated annealing; Indicator Simulation; Truncated-Gaussian Simulation; Application of simulations

- Exercises

**Stochastical Modeling:**
The lecture part stochastic modeling is primarily concerned with the stochastic analysis of temporal and areal arrays, their generation and their use in the hydrological modeling. Calculation and analysis of hydrological data, descriptive statistic and their parameters, possibility analysis, correlation and regression, time series analysis and simulation.

**Content:**
- Univariate Statistics and multivariate Statistics (e.g. regression analysis)
- theory of probabilities
- random variables and probability functions (e.g. Poission distribution)
- estimation of parameters (e.g. Maximum Likelihood Method)
- statistical tests (e.g. Kolmogorov-Smirnov test)
- extreme value statistics (analysis of the frequency of occurrence of floods)
- time series analysis (e.g., ARMA Models)
- stochastic simulations (Monte-Carlo Methods)

      ➔ Zusatzmodule

11. Empfohlene Voraussetzungen: None

12. Lernziele:

   **Power Demand, Supply and Distribution:**
   The students...
   • know the German, European and worldwide energy markets related to demand, supply and its distribution capabilities
   • are aware of that non-renewable energy sources are strictly limited and time-scales for conversion of energy markets long
   • have an idea about the relations between energy, politics, social changes and influences on environment
   • have a basic knowledge about present energy conversion systems, theoretical limits of efficiencies, and the potential to enhance applied technology
   • have a basic understanding about where and how energy is provided and distributed
   • comprehend the balance between load and supply in electrical grids and the resulting necessity for control energy.

   **Water Demand, Supply and Distribution:**
   The students...
   • know the German and worldwide water systems related to demand, supply and its distribution capabilities
   • have an overview on the water supply situation all over the world.
   • recognize the different possibilities and levels of water supply
   • have an idea of the relations between water, politics, social changes and influences on environment.

13. Inhalt: **Power Demand, Supply and Distribution:**
• Energy demand, energy supply
• Energy generation
  - overview of different types of power plants
  - renewable energy
  - thermal power plants (conventional and nuclear)
• Areas of application of different power plants
• Emission control techniques
• Cooling of thermal power plants
  - methods
  - water resources aspects
• Energy transport and energy storage
• Net techniques
• Energy market
  - trade
  - politics
  - law
• social changes due to energy supply

**Water Demand, Supply and Distribution:**

• Water supply and water distribution: necessity, basic requirements, elements, hydrological cycle
• Water demand calculation: water consumption, water demand, consumer groups, losses, forecasting, design periods
• Water collection: Selection of source, groundwater withdrawal, springwater tapping, surface water intakes, rainwater harvesting, seawater desalination, recycling of treated sewage, drinking water protection areas
• Water transmission and distribution: necessity, hydraulic basics, dimensioning and calculation of branched and closed loop systems.
• Pumps and pumping stations: necessity, types, hydraulics for pumping design, pumping stations and pressure boosters
• Water storage: necessity, types and functions of tanks and reservoirs
• Case study: planning and design of a water supply system for a small town

14. Literatur:
Lecture notes can be downloaded from the internet. Hints are given for additional literature from the internet as well as libraries.

15. Lehrveranstaltungen und -formen:
• 151601 Vorlesung Energy Demand, Supply and Distribution

Time of attendance: 45 h
Private Study: 135 h

17. Prüfungsnummer/n und -name:
15161 Water and Power Supply (PL), schriftliche Prüfung, 120 Min., Gewichtung: 1.0

18. Grundlage für ... :

19. Medienform:

20. Angeboten von:
Modul: 80990 Master`s Thesis WAREM

2. Modulkürzel: - 5. Modulsdauer: 1 Semester
3. Leistungspunkte: 30.0 LP 6. Turnus: jedes Semester
4. SWS: 20.0 7. Sprache: Englisch

8. Modulverantwortlicher: Univ.-Prof. Silke Wieprecht

10. Zuordnung zum Curriculum in diesem Studiengang:
   DoubleM.D. Water Resources Engineering and Management
   → Chalmers -->Incoming
   DoubleM.D. Water Resources Engineering and Management
   → Mara -->Incoming
   M.Sc. Water Resources Engineering and Management

11. Empfohlene Voraussetzungen:
The topic of the Master Thesis can be handed out only the moment at least 78 credit points have been acquired already by the candidate. One month after 90 credit points have been acquired the candidate is supposed to start the work on his master thesis or to ask for the assignment of the topic at the latest.

12. Lernziele:
   Capability to implement an independently composed project schedule for the treatment of a recent scientific problem in an international research environment.
   Effective scientific work in a team, enforcement of strategies internally and particularly externally. Acquire the necessary stamina to not be discouraged by unexpected problems and throwbacks in scientific projects and to finally be successful by the formulation of alternative methods of resolution.
   Multidisciplinarity through contacts with representatives of other fields like Chemistry, Mathematics, Informatics, etc.
   Obtaining the capability to discuss the own results of research in the environment of the recent international research comprehensively and to represent them in written (Master’s Thesis) and oral (talk) form.

13. Inhalt:
   Treatment of a recent scientific problem in an international research environment.
   The successful treatment of the scientific problem requires the specialisation in the related field of research and the acquisition of the necessary knowledge.

14. Literatur:
   Recent literature on the topic of the scientific problem

16. Abschätzung Arbeitsaufwand: 900 h (Contact time: 900 h)
